1 INTRODUCTION

The EUMETSAT "Satellite Application Facilities" (SAF) are dedicated centres of excellence for processing satellite data, and form an integral part of the distributed EUMETSAT Application Ground Segment (http://www.eumetsat.int). This documentation is provided by the SAF on Support to Nowcasting and Very Short Range Forecasting, NWC SAF. The main objective of NWC SAF is to provide, further develop and maintain software packages to be used for Nowcasting applications of operational meteorological satellite data by National Meteorological Services. More information can be found at the NWC SAF webpage, http://nwc-saf.eumetsat.int. This document is applicable to the NWC SAF processing package for geostationary meteorological satellites, NWC/GEO.

1.1 SCOPE OF THE DOCUMENT

This document is the User Manual for the Convection Products components GEO-CI (Convection Initiation) and GEO-RDT-CW (Rapidly Developing Thunderstorm – Convection Warning) of the NWC/GEO software package.

This document contains practical information of the aforementioned products, on their applicability and limitations.

1.2 Scope of other documents

The algorithms used to extract the GEO Convection Products are detailed in the algorithm theoretical basis document for Convection products.

The validation of the algorithms used to extract the GEO Convection Products is reported in the validation report for Convection products ([RD.2.]).

Instructions to install, configure and execute the NWC/GEO software in order to extract the GEO Convection Products are detailed in the software user manual ([RD.3.]).

The interface control documents ([AD.6.]) (for the Internal and External Interfaces of the SAFNWC/GEO) and ([AD.7.]) (GEO Output Product Format Definition) detail the input and output data format for the SAFNWC/GEO software.

1.3 SOFTWARE VERSION IDENTIFICATION

This document describes the products obtained from the GEO-CI v2.23 (Product Id NWC-089) from the GEO-RDT-CW v5.23 (Product Id NWC-090) implemented in the release 2021.3 of the NWC/GEO software package.

1.4 IMPROVEMENT FROM PREVIOUS VERSION

Improvements from previous releases are:

- GEO-RDT-CW and GEO-CI (in decreasing order of importance)
 - In v2021.1: support to GOES-18 satellite
 - In v2021.3: update of the product_quality NetCDF attribute: value is penalized if NWP data are missing
 - In v2021.1: addition of the land/sea mask, of the sun and satellite angles in RDT-CW attributes

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 8/40

- In v2021.1, v2021.2: code optimization and bug corrections
- GEO-RDT-CW (in decreasing order of importance)
 - In v2021.2: Switch MSG3 / MSG4: update of RDT discrimination files.
 - In v2021.1: Improvement of the cell detection toward a limitation of number of cells in very specific cases
 - In v2021.3: Bug correction and handling of long mature trajectories (toward a faster declassification)
 - o In v2021.3: distinction of the polarity of intra-cloud lightning (provided by some ground-based lightning network)
 - In v2021.3: optional choice of the type of cells to output in RDT NetCDF file.
 - In v2021.3: Bug correction in the overshooting tops algorithm

GEO-CI

- o In v2021.1: addition of a filter to remove pixels belonging to a large cell (over 10 000 km²)
- o In v2021.1: the cloud type a previous slots is taken into account when computing parameter's trends.

1.4.1 Definition, Acronyms and Abbreviations

See [RD.1] for a complete list of acronyms for the NWC SAF project.

Page 10/40

2 CONVECTION INITIATION (GEO-CI) PRODUCT

2.1 DESCRIPTION OF GEO-CI PRODUCT

2.1.1 Goal of CI product

CI provides the probability for a cloudy pixel to become a thunderstorm in a given following period (30, 60 or 90 minutes). The product aims to catch the first steps of initiation of convection, when the first convective signs occur after the formation of clouds, or when those signs appear revealing a modification of environmental conditions.

2.1.2 Description of CI process and analysis

The CI is a mix of object and pixel analysis, of physical and statistical approach. The methodology is

- 1. to identify areas of interest, which are areas of *eligible-CI* pixels
- 2. to determine a guess of **2D movement field** to be representative of cloudy pixel movement
- 3. to undertake, over areas of interest, cloud cell detection and tracking in order to
 - correct, update and complete the 2D movement field
 - increase the number of slots from which the pixel is tracked
- 4. to calculate satellite characteristics of these pixels, including historic of the pixel thanks to 2D movement field (*static and dynamic characteristics*)
- 5. to determine *pre-CI* pixels using relevant thresholds of parameters
- 6. finally to evaluate convection through probability assessment, and localize corresponding *CI* pixels

The algorithm is described in ATBD. Some improvements from v2016 to v2018 have been defined in [RD.4.].

Relevant parameters, thresholds and some part of the algorithm are inspired from « Best Practice Document » [RD.4.], especially SATCAST methodology for the definition of pre-CI pixels. Major improvements of versions following the first v2016 release have been defined during the Visiting Scientist activity in the period June-December 2016 [RD.5.] and a first objective validation has been performed during a AS activity [RD.7].

2.1.3 Description of output

The content of the output in NetCDF format is described in the Data Output Format document ([AD.8.]). The product is an image-like product, whose target structure contains three main containers dedicated to the three specified periods [0-30mn], [0-60mn] and [0-90mn].

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Date: 22nd February 2024 **Issue:** 2.1.0 File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt Page 11/40

Container	Content
ci_prob30	NWC GEO CI Probability next 30 minutes
	Class 0: no probability to become thunderstorm
	Class 1: 0-25% probability to become thunderstorm in the next 30minutes
	Class 2: 25-50% probability to become thunderstorm in the next 30minutes
	Class 3: 50-75% probability to become thunderstorm in the next 30minutes
	Class 4: 75-100% probability to become thunderstorm in the next 30minutes
	FillValue: No data or corrupted data
ci_prob60	NWC GEO CI Probability next 60 minutes
	Same classes and meaning than for ci_prob30, but referred to the next 60 minutes
ci_prob90	NWC GEO CI Probability next 90 minutes
	Same classes and meaning than for ci_prob30, but referred to the next 90 minutes
ci_quality	Value 8: good
	Value 16: questionable
	Value 24: bad
ci_status_flag	6 bits indicating (if set to 1)
	Bit 0: High_resolution_satellite_data_used
	Bit 1: Visible_data_used
	Bit 2: IR3.9µm_data_used
	Bit 3: Cloud_type_data_used
	Bit 4: Cloud_Microphysic_data_used
	Bit 5: NWP_data_used

Table 3: CI NetCDF output containers

Note: The common attributes product quality and product completeness are filled as follow:

- Completeness = percentage of usable pixels compared to total number of pixels (usable means non space and available data)
- Quality = percentage of available data, processed as weighted average of available data. Weights are following
 - 50% from mandatory data (current and previous IR10.8 channel)
 - 50% from optional data
 - 25 % from NWP data
 - 25 % from other NWC SAF products (CT, HRW, CMIC)

2.2 IMPLEMENTATION OF CI

The implementation of the CI software follows the general implementation of components of the SAFNWC/MSG software.

Basically, the following steps are needed to proceed:

- 1. Create or update configuration files (system, region, and run configuration files) according to their format (see the Interface Control Document ICD/1 for the External and Internal Interfaces of the SAFNWC/MSG).
- 2. Update, if necessary, the CI configuration file
- 3. Ensure that the satellite image SEVIRI file in HRIT format or SAFNWC-compliant FSD format-(mandatory input) is available in \$SAFNWC/import/Sat data/. To process CI in real-time, the user has to refresh this directory with the most up-to-date data.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 12/40

4. Ensure that the directory \$SAFNWC/import/NWP_data has been provided with latest NWP multiple GRIB data (not mandatory but recommended), and that these data have been remapped by the TM on the specified region (remapped NWP data available in the \$SAFNWC/tmp directory). CI configuration file is used as guidance for the use and remapping of NWP data.

Then, the processing of CI is automatically monitored by the task manager (see the Software Users Manual for the Task Manager of the SAFNWC/MSG software).

2.2.1 CI reprocessing cases

Like RDT-CW software, CI undertakes a tracking of cloud cells from one image to the following, but focused here on small warm ones. In real-time there is a kind of continuity. But in reprocessing cases, the starting point has to be clearly defined, as explained hereafter.

If a user wants to focus on a specific period, he has to run CI software at least one hour before: it helps to have a stabilized tracking and reliable cloud cell motion estimation.

- Cloud speed estimate takes into account the speed at previous step. At the beginning, only guess field, neighbouring cells and correlation process allow to estimate speed movement. Then, overlapping technique and previous track allow to improve the estimate.
- Diagnostic scheme needs at least 30min recent historic to analyse trends on first slots and up to 30min depths.
- When CI software runs, it creates backup files identified for each slot. They will be used for the next step. Those backup files get information from several previous steps.

Cases starting point will be defined according to the situation the user wants to study.

2.2.2 CI monitoring

End-users may define several criteria in order to monitor a CI production chain. Classical criteria are processing time or auxiliary files availability. One additional criteria the developers would recommend is to use the number of pre-CI pixels, the number of pixels associated with a probability between 0 and 50% and the number of pixels associated with a probability between 50 and 100%. It is the criteria used in monitoring system on NWCSAF website.

2.3 INPUT AND CONFIGURABLE PARAMETERS FOR CI

2.3.1 List of inputs

2.3.1.1 Mandatory inputs

Three different kinds of mandatory inputs are needed by the CI software in order to proceed correctly:

2.3.1.1.1 Satellite images

These images are provided as input to the CI software by the user. These images must be located in the relevant directory \${SAFNWC}/import/Sat_data, (for more details please refer to the Software Users Manual for the NWC/GEO software).

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 13/40

Mandatory channels are IR10.8, WV6.2, WV7.3, IR8.7, IR12.0 and 13.4μm channels, and are to be available also for the previous slot. Channel #15 (IR 10.3μm) is recommended to be used for GOES16 satellite.

2.3.1.1.2 Configuration file

Beside the SAFNWC general configuration files (system, run and region configuration files, see the Interface Control Document ICD/1 for the External and Internal Interfaces of the NWC/GEO), the following configuration file must be created or updated in order to process CI on a region. <u>CI model configuration file</u>. It is composed of keywords and values which will be used by the CI software. It must be located in the \$SAFNWC/config directory. The list of keywords and their significance is described into the next paragraph.

2.3.1.1.3 Auxiliary files

In order to perform a convective initiation analysis, the CI software makes use of coefficients file located in the directory \$SAFNWC/import/Aux_data/CI. Those files are delivered with the NWC/GEO software and must not be modified by the user.

2.3.1.2 Optional inputs

Up to four optional inputs should be provided to CI software for an optimal product:

2.3.1.2.1 NWP data

Even if optional from a technical and functional point of view, NWP data is strongly recommended for a more efficient result. Most recent NWP data has to be located in the directory \$SAFNWC/import/NWP data. When remapped in \$SAFNWC/tmp directory, NWP data is used for two objectives:

- Read or re-compute instability indexes, to synthesize a "NWP convective mask" valid for the slot date. This mask allows to exclude stable areas from analysis process.
- Extract 850hPa U/V wind component as guess for movement field for cold start or for orphan cloud cells for which no tracking allowed to compute displacement.

The CI configuration file is used as guidance for the use and remapping of NWP data, by listing all desired parameters (see next section). The CI default configuration file of NWC SAF package lists parameters needed from compliant NWP data. Some parameters that are not initially available, may be estimated from others: humidity at 2m (ARPEGE relative humidity or ECMWF dew point temperature), orography (ARPEGE ground height or ECMWF geopotential).

The NWP elements that will be taken into account by GEO-CI are:

- Instability indexes: previously computed and saved as DATABUF for other products or recomputed
- U/V wind component

CI has been designed so that the dependence of NWP is limited. It allows mainly to take advantage from movement guess field and convective environment. CI performances should not be highly impacted by changing horizontal and temporal resolution of NWP fields. But of course, the lower horizontal and temporal resolutions are, the more detailed the analysis of convective environment and atmospheric motion are.

Issue: 2.1.0 Date: 22nd February 2024

File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection_v2.1.0.odt

Page 14/40

2.3.1.2.2 CT product.

In the CI software, it is possible to take benefit from CT product of the NWC/GEO. This integration is optional. It allows using CT product as mask product for ignoring cloud-free areas and for filtering relevant pixels in CI process.

In order to use the CT product as input to the CI software for masking clear pixels, the user has to ensure that:

- i. the CT product is generated on the desired region
- ii. the parameter "CT" of the model configuration file (see next section) is set to 1.

2.3.1.2.3 CMIC product

In the CI software, it is possible to take benefit from CMIC product of the SAFNWC/GEO. This integration is optional. It allows using CMIC product for filtering relevant pixels in CI process, and micro-physics parameter's values for CI diagnosis in day configuration.

In order to use the CMIC product as input to the CI software, the user has to ensure that

- i. The CMIC product is generated on the desired region
- ii. And the parameter "CMIC" of the model configuration file (see next section) is set to 1.

The use of CMIC in CI software is done as follows:

- The Cloud Top Phase parameter of CMIC product is used for filtering "ice" cases, and focus on pixels/cloud systems in liquid or mixed phase
- In daily conditions, micro-physics parameters Cloud Optical Thickness, Liquid Water Path and Ice Water Patch are used for an additional filtering to exclude non significant pixels, and for a final diagnosis using additional specific tuning

2.3.1.2.4 HRW product

In the CI software, it is possible to take into account HRW Atmospheric Motion Vectors to process, with U/V NWP winds, a guess for movement field.

This integration is optional. In order to use the HRW product as input to the CI software for improving the cloud cell motion estimation, the user has to ensure that

- i. The HRW product is generated on the desired region
- ii. The parameter "HRW" of the model configuration file (see next section) is set to 1.

The use of HRW into the CI software is done as follows:

- Predictor winds available for the current slot are read in temporary directory of SAFNWC
- Those observations are remapped with a defined tolerance onto region definition in order to fill a movement field

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 15/40

- This movement field is completed from U/V NWP winds read from low-mid NWP levels (for areas where no HRW retrievals are available)
- This guess movement field is made available for cloud-cell tracking, which allows a better initiation of cloud cell movement.
- Then, cloud cell tracking allows improving this field with update by motion vectors related to objects, leading to an optimal blending (NWP+HRW+cell's tracking). This movement field will be used as pixel tracker for following purposes of CI software.

2.3.2 Model Configuration File and configurable parameters

The CI model configuration file contains all the flags and values required for the derivation of the product. The model configuration file must be placed in the \$SAFNWC/config directory. The file contains the following information, among which user's configurable parameters are highlighted:

Keyword	Description	Туре	Default Value(s)
PGE ID	Identifier of the PGE	Chain of	GEO-CI
_		characters	
SEV_BANDS	SEVIRI channels to be used	Chain of	WV62 WV73 IR87
_		characters	IR108* IR120 IR134
			*IR103 for GOES16
NWP_PARAMxx(*)	U component of wind at various pressure	Chain of	NWP_UW 1 BLI
	levels	characters	
NWP_PARAMxx(*)	V component of wind at various pressure	Chain of	NWP_VW 1 BLI
	levels	characters	_

Page 16/40

2.4 CI OPERATIONS

2.4.1 Procedure

2.4.1.1 Input data files needed for GEO-CI product generation

- Mandatory input data like satellite data configuration files and auxiliary files as listed in paragraph 2.3.1.1
- Optional input data (NWP, other NWCSAF products) as listed in paragraph 2.3.1.2
- PGE configuration file as detailed in paragraph 2.3.2

2.4.1.2 Output files obtained from GEO-CI product generation

The following output files are generated if GEO-CI runs successfully:

- GEO-CI product
 S_NWC_CI_satellite_region-VISIR_YYYYMMDDThhmmssZ.nc
 in the directory \$SAFNWC/export/CI
- Backup files
 GEO-CI_regionname_Carte_sauvegarde_YYYYMMDDHHmm, and
 GEO-CI_regionname_sauvegarde_YYYYMMDDHHmm

 MFT_regionname_dx_0_YYYYMMDDHHmm

 MFT_regionname_dy_0_YYYYMMDDHHmm

 MFT_regionname_umvt_0_YYYYMMDDHHmm

 MFT_regionname_vmvt_0_YYYYMMDDHHmm

The following command is used to process GEO-CI manually, without the presence of the TM:

in the directory \$SAFNWC/tmp

2.4.2 Examples

GEO-CI-v223 2015-04-07T12:00:00Z safnwc MSGN.cfg safnwc CI.cfm

This command executes GEO-CI over the region safnwc_MSGN.cfg manually, without the presence of the TM

2.4.3 Caution and warning messages

See paragraph 4 for the list of error messages

If everything is correct then the following message is received:

CPU time Slot YYYY-MM-DDTHH:mm:ssZ end GEO-CI: <time> secs

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 17/40

2.4.4 Known errors, causes and solutions

None.

2.5 CI VALIDATION

2.5.1 Validation results

Validation report [RD.2.] fully describes the validation results. Some validation results of GEO-CI v2018 relies on the work undertaken in the AS activity [RD.7.].

2.5.2 Typical known problems and recommendation for user

This version of GEO-CI offers a basic approach with most relevant parameters which have been previously identified by others studies for this topic. However, the objective is not to exactly clone the previous approaches, but to offer a different use of the output for nowcasting purposes, with the wish to take into account uncertainty of the forecast through probability information. CI can also be used as a Yes/No product

GEO-CI focuses on warm and cloudy pixels, in an unstable environment, ignoring growing and already mature convection. Thus, when displaying GEO-CI product, most pixels have no information or non significant signal.

2.6 EXAMPLES OF VISUALISATION

Examples of CI visualisation are proposed hereafter.

Figure 1: 28/06/2010 - 13Z IR image - accumulated Radar signal >35dBZ over [13-13h30Z] - CI prob30 container valid for [13-13h30Z]. New colour palette included in NetCdF files (bottom).

Page 19/40

3 RAPIDLY DEVELOPING THUNDERSTORM – CONVECTION WARN-ING (GEO-RDT-CW) PRODUCT

3.1 Description of the RDT-CW product

3.1.1 Goal of RDT-CW product

The RDT-CW product has been developed by Météo-France in the framework of the EUMETSAT SAF in support to Nowcasting. Using mainly geostationary satellite data, it provides information on clouds related to significant convective systems, from meso scale (200 to 2000 km) down to smaller scales (tenth of km). The objectives of RDT-CW are:

- The identification, monitoring and tracking of intense convective system clouds
- The detection of rapidly developing convective cells, where IR sensor allows for
- The forecast of the convective cells

Figure 3: RDT-CW scheme

The object-oriented approach underlying the RDT-CW product allows to add value to the satellite image by characterizing convective systems with various parameters of interest for the forecaster: motion vector, cooling and expansion rate, cloud top height,..., and associated time series of these parameters. It supports easily and meaningfully downstream data fusion (surface observations, NWP fields and radar data).

Thereby, RDT-CW is a tool for forecaster but can also be used by research teams, and end-users like aeronautical users.

Finally, a NWC SAF real-time demonstration is available on the Internet, at this address: http://nwc-saf.eumetsat.int. Some training materials are available on EUMETrain Website http://eumetrain.org.

3.1.2 Description of RDT-CW process and analysis

The RDT-CW algorithm could be divided into four steps:

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 20/40

- The detection of cloud systems
- The tracking of cloud systems
- The discrimination of convective cloud objects
- The forecast of convective cloud objects

Detection, tracking and discrimination can be grouped together in "analysis part". The algorithm is described in ATBD

It is to note that GEO-RDT-CW discrimination step has been revised since v2018: an additional discrimination scheme labelled as "calibrated" (CAL) is based on satellite-calibrated coefficients, available for some current geostationary satellites. Previous discrimination scheme, labelled as "generic" (GEN), remains available in all cases.

3.1.3 Description of RDT-CW outputs

The default output format of RDT-CW product is NetCDF. Depending on user configuration, an intermediate optional output is possible with Trajectory ASCII output.

3.1.3.1 NetCDF output

The content of the GEO-RDT-CW output in NetCDF format is described in the Data Output Format document ([AD.8.]). A very brief summary is given below, taking into account that this mainly bulletin-like file lists a large number of variables/attributes, taking into account horizontal, vertical and temporal description of each cloud cell. But this output may also include an image part.

- The <u>bulletin-like part</u> of the product relies on several dimensions: number of cells, number of contour points for horizontal description, number of levels, slices and overshooting tops for vertical description, number of trajectory points for a temporal description.
- The <u>overview part</u> of the output lists some characteristics of cloud cell population. It may also include an additional optional *map of type and phase* of cloud cells (not the default mode). It is possible to activate the encoding of this map (user action with NCMAPIN-CLD argument of configuration file set to 1)
- The *cell part* details the spatial and temporal description of the cloud system
 - The <u>main description part</u> lists for each cloud system identity characteristics, date type and other characteristics (type, movement, cooling rate, severity ...) which concern the whole cloud system
 - The <u>level and contour description part</u> lists for each cloud system and each "bottom" and "top" threshold level the localization parameters (contour and gravity centre), satellite characteristics, morphological characteristics and data fusion parameters (lightning, other products, etc.).
 - The <u>vertical surface description part</u> lists for each cloud system pairs of threshold brightness temperature and surface allowing vertical morphological description
 - The <u>historical description part</u> lists for each cloud system a limited set of characteristics of its recent past (maximum 12 time steps corresponding to satellite refresh rate): localization of gravity centre, satellite and morphology characteristics, movement and trends. This part makes the RDT-CW output independent of previ-

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024

 $\textbf{File:} NWC\text{-}CDOP3\text{-}GEO\text{-}MF\text{-}PI\text{-}SCI\text{-}UM\text{-}Convection_v2.1.0.odt}$

Page 21/40

ous outputs, when users want to manage trajectory of the cloud system and main temporal characteristics. A more complete temporal description will imply to manage previous outputs.

• The <u>overshooting top description part</u> lists all detected overshooting tops, their localization, characteristics and reference to the corresponding cloud system

Forecast products

- Forecast products are only bulletin-like product, without map container. Moreover, the set of variables/attributes is more restricted: only main and bottom level description.
- There is one forecast product for each given lead range. The maximum lead range may be configurable, but cannot exceed 1h. Forecast step is also configurable, and is set by default to the satellite update rate. For example the default configuration with MSG leads for a 1-hour forecast to 5 output files produced, one for the analysis, and 4 for +15, +30, +45 and +60min lead ranges.

Note: The common attributes product quality and product completeness are filled as follow:

- Completeness = percentage of usable pixels compared to total number of pixels (usable means non space and available data)
- Quality = percentage of available data, processed as weighted average of available data,
 Weights are following
 - o 50% from mandatory data (current and previous IR10.8 channel)
 - o 50% from optional data
 - 25 % from NWP data
 - 10 % from LGH data
 - 15 % from other NWC SAF products (CT, CTTH, CMIC, CRRPh)

3.1.3.2 CTRAJ intermediate output

The RDT-CW may process an intermediate output, CTRAJ, in ASCII format. This file describes all cloud trajectories ended during the time slot (description of the past tracking of achieved cloud systems). The format of this file is updated with new optional additional data. This output is updated at each slot, in a dedicated, daily or monthly file depending on user's model configuration file.

Content of this file is described in [AD.8.] documentation.

3.2 IMPLEMENTATION OF RDT-CW

3.2.1 General Considerations

The implementation of the RDT-CW software follows the general implementation of components of the SAFNWC/MSG software.

Basically, the following steps are needed to proceed:

- 1. Create or update configuration files (system, region, and run configuration files) according to their format (see the Interface Control Document ICD/1 for the External and Internal Interfaces of the NWC/GEO).
- 2. Update, if necessary, the RDT-CW configuration file

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date:22nd February 2024

 $\textbf{File:} NWC\text{-}CDOP3\text{-}GEO\text{-}MF\text{-}PI\text{-}SCI\text{-}UM\text{-}Convection_v2.1.0.odt}$

Page 22/40

3. Ensure that files for convective discrimination (coefficient matrix and matrix mask) are available in repository "\$SAFNWC/import/Aux_data/RDT-CW/files_for_discri":

- a. Generic discrimination:
 - i. ConvCoeffRegr and ConvCoeffRegr mask applicable for all satellites
 - ii. ConvCoeffRegr 5 and ConvCoeffRegr 5 mask for MSG Rapid Scan
- b. Calibrated discrimination

ConvCoeffRegr.satellitename.updaterate and ConvCoeffRegr.satellitename.updaterate_mask where satellitename is the name of geostationary satellite that is intended to be used by the user, and updaterate is expressed in minutes ¹

ConvCoeffRegr.*satellitename.updaterate.15* and ConvCoeffRegr.*satellitename.updaterate.15*_mask when channel #15 is preferred for IR window main channel, and specific tuning available (i.e. GOES-R/S/T and HIMAWARI08/09 family satellites essentially)

- 4. Ensure that the satellite data is available in the directory \$SAFNWC/import/Sat_data/ (SEVIRI image file in HRIT format or netcdf format for Foreign Satellite Data). To process RDT-CW in real-time, the user has to refresh this directory with the most up-to-date data.
- 5. Ensure that the directory \$SAFNWC/import/NWP_data has been provided with latest NWP multiple GRIB data (not mandatory but recommended), and that NWP data has been remapped by the TM on the specified region (remapped NWP data available in the \$SAFNWC/tmp directory). RDT-CW configuration file is used as guidance for the use and remapping of NWP data.
- 6. Depending on user's specifications, ensure that the lightning data file (optional input) is available in the directory \$SAFNWC/import/Obs_data/Lightning. The name of this file and its content must be compliant with the Interface Control Document ICD/1 for the External and Internal Interfaces. To process RDT-CW in real-time, the user has to refresh this directory with the most up-to-date data. It is also recommended not to include unnecessary (old) lightning data in order to avoid useless processing.

Then, the processing of RDT-CW is automatically monitored by the task manager (see the Software Users Manual for the Task Manager of the SAFNWC/MSG software).

3.2.2 RDT-CW reprocessing cases

This is a particularity of the RDT-CW software to undertake a tracking of cloud cells from one image to the following. In real-time there is continuity. But in reprocessing cases, the starting point has to be clearly defined:

If user wants to focus on a specific period, he has to run RDT-CW software at least one hour before, and ideally 2 hours.

• Cloud speed estimate takes into account the speed at previous step. At the beginning, only guess field, neighbouring cells and correlation process allow to estimate speed movement. Then, overlapping technique and previous track allow improving the estimate.

¹ Note for GOES16 and HIMAWARI08: when the satellite nominal update rate, as mentioned in satellite configuration file, is different from the dataset available for the tuning, both values are mentioned for identifying discrimination matrices, even if those matrices are identical.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 23/40

- Discrimination scheme needs also a recent historic to calculate trends on various depths.
- When RDT-CW software runs, it creates backup files identified for each slot, which will be used for the next step. These backup files get information from several previous steps.

Cases starting point will be defined according to the situation the user wants to study.

3.2.3 RDT-CW monitoring

End-users may define several criteria in order to monitor a RDT production chain. Classical criteria are processing time or auxiliary files availability. One additional criteria the developers would recommend is to use the number of cells over a domain and the number of convective ones'. It is the criteria used in monitoring system on NWCSAF website. One can see in figure below a normal variation of the criteria over the reference domain (northern part of MSG disk), with

- A stable number of cells,
- A normal ratio convective/non convective cells (around one in ten). Note: the ratio is lower in nature but after a NWP filter (instability indices) RDT-CW is operated on unstable areas only
- A normal increase of convection during day-time

Figure 4: 2-days monitoring of RDT-CW

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection

Page 24/40

3.3 Inputs and configurable parameters for RDT-CW

3.3.1 List of inputs

3.3.1.1 Mandatory inputs

Three different kinds of mandatory inputs are needed by the RDT-CW software in order to proceed correctly:

3.3.1.1.1 Satellite images.

These images are provided as input to the RDT-CW software by the user. These images must be located in the relevant directory \${SAFNWC}/import/Sat_data, (for more details please refer to the Software Users Manual for the NWC/GEO software).

Mandatory channel is #16 (IR 10.8μm channel for MSG satellites) or #15 (IR 10.3μm for GOES and HIMAWARI satellites) as main channel, and has to be available also for the previous slot. Channels#(15 or 16) and WV6,2 are mandatory for discrimination. Optimal processing of RDT-CW for convective discrimination will be obtained with the use of VIS0.6, IR1.6, IR2.2, IR3.8,, WV7.3, IR8.7 and IR12.0 channels.

In order to improve overshooting top detection efficiency, it is possible to take benefit from HR in visible channels, when available. For that purpose, HR_VIS argument has to be set to 1 in configuration file. Depending on satellites, HR VIS argument set to 1 will lead to:

- For MSG satellites, HRV channel will be used additionally to normal resolution VIS0.6μm channel.
- For other satellites, VIS0.6µm will be read at high resolution. Please note that RDT discrimination scheme relies, among others, on channel reflectance difference RD=NIR16-VIS06 during daytime. In the case of HR_VIS set to 1 and NIR16 channel not available at high resolution, VIS06 will not be used at high resolution

Moreover, channels IR97 and IR134 may be optionally used for BTD computation with IR108, available in CTRAJ intermediate product for further studies.

3.3.1.1.2 Configuration files.

Beside the NWC SAF general configuration files (system, run and region configuration files, see the Interface Control Document ICD/1 for the External and Internal Interfaces of the NWC/GEO), the following configuration file must be created or updated in order to process RDT-CW on a region:

RDT-CW model configuration file. It is composed of keywords and values which will be used by the RDT-CW software. It must be located in the \$SAFNWC/config directory. The list of keywords and their significance is described into the next paragraph.

3.3.1.1.3 Auxiliary files

In order to perform a discrimination of convective systems, the RDT-CW software makes use of discrimination files located in the directory \$SAFNWC/import/Aux_data/RDT-CW/files_for_discri. These files are delivered with the NWC/GEO software and must not be modified by the user. For

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 25/40

more details on these files, please refer to the Interface Control Documents ICD/1 for the External and Internal Interfaces of the NWC/GEO.

3.3.1.2 Optional inputs

Up to seven optional inputs should be provided to RDT-CW software for an optimal product:

3.3.1.2.1 NWP data

Even if optional from a technical and functional point of view, NWP data is strongly recommended for a more efficient result. Most recent NWP data has to be located in the directory \$SAFNWC/import/NWP_data. When remapped in \$SAFNWC/tmp directory, NWP data is used for following purposes:

- Read or re-compute instability indexes, to synthesize a "NWP convective mask" valid for the slot date. This mask allows to exclude stable and neutral areas from discrimination process, and thus to avoid eventual false alarms.
- Read or re-compute tropopause temperature, to be provided to discrimination scheme with Lifted Index.
- Take benefit from Tropopause temperature to validate Overshooting Top detection.
- Extract 700hPa U/V wind component as guess for movement field for cold start of RDT-CW or for orphan cloud cells for which no tracking is possible.

The RDT-CW configuration file is used as guidance for the use and remapping of NWP data, by listing all desired parameters (see next section). The RDT-CW default configuration file of NWCSAF package lists parameters needed from compliant NWP data. Some parameters that are not initially available may be estimated from others: humidity at 2m (ARPEGE relative humidity or ECMWF dew point temperature), orography (ARPEGE ground height or ECMWF geopotential), tropopause characteristics (available with ARPEGE, reprocessed with ECMWF).

The NWP elements that will be taken into account by RDT-CW are

- Instability indexes: previously computed and saved as DATABUF for other products or recomputed
- Tropopause temperature diagnosis: previously computed and saved as DATABUF for other products or recomputed
- U/V wind component

RDT-CW has been designed so that the dependence of NWP is limited. It allows mainly to take advantage from better statistical models. RDT-CW performances should not be highly impacted by changing horizontal and temporal resolution of NWP fields. But of course, the lower horizontal and temporal resolutions are, the more detailed the analysis of NWP convective environment is.

3.3.1.2.2 Lightning data file

In order to characterize electrical activity of convective systems (counting of lightning flashes detected below the cloud systems) and eventually to force the discrimination of convective systems using lightning data, the RDT-CW software may use data issued from ground lightning network and/or from satellite sensor.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 26/40

Lightning data files have to be created or supplied, and regularly updated in the directory \$SAFNWC/import/Obs_data/Lightning/. Files content must be lightning data (see the Interface Control Documents ICD/1 for the External and Internal Interfaces of the NWC/GEO to have details on the format and the naming of this file) applicable to the processed region.

The values of the parameters "LGHDTANT" and "LGHDTPOST" of the model configuration file (see next section) allow GEO-RDT-CW to extract just what is necessary from the available lightning files. More precisely, for a given time slot, all the lightning data detected between the times slot-LGHDTANT and slot+LGHDTPOST are extracted from the available lightning data files.

To process RDT-CW in real-time, the user has to provide \$SAFNWC/import/Obs_data/Lightning/ with the most up-to-date data. It is also recommended not to include unnecessary (old) lightning data in order to avoid useless processing.

If such data is not provided as input, the only consequences are that the discrimination of convective systems is based only on satellite characteristics of the cloud systems and that the electrical characterization of convective systems is set to missing values.

The choice to use or not lightning data as optional input to the RDT-CW software and/or as forcing data for its discrimination scheme, is controlled by the parameters "LGH" for ground lightning data or "SLGH" for data issued from satellite sensor of the model configuration file (see next section).

3.3.1.2.3 CTTH product

In the RDT-CW software, it is possible to document the cloud top pressure of cloud systems detected and tracked by the software. This is done through the integration of the CTTH product of the NWC/GEO into the RDT-CW product.

This integration is optional. In order to use the CTTH product as input to the RDT-CW software the user has to ensure that i) the CTTH product is generated on the desired region and that ii) the parameter "CTTH" of the model configuration file (see next section) is set to 1.

The integration of this CTTH into the RDT product is done as follows:

For a given detected cloud system, the corresponding cloud top pressure is defined as the Q10 value of the distribution of the CTTH pressure product over the horizontal extension of the cloud system.

3.3.1.2.4 CT product

In the RDT-CW software, it is possible to document the type of cloud systems detected and tracked by the software. This is done through the integration of the CT product of the NWC/GEO into the RDT product.

This integration is optional. It allows also using CT product as mask product for ignoring cloud-free areas in RDT-CW processing.

In order to use the CT product as input to the RDT-CW software for masking clear pixels, the user has to ensure that:

- the CT product is generated on the desired region and that:
- the parameter "CMa" or the parameter "CT" of the model configuration file (see next section) is set to 1.

In order to use the CT product as input to the RDT-CW software for additional attributes to RDT cloud cells, the user has to ensure that:

• the CT product is generated on the desired region and that

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date: 22nd February 2024

File:NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection_v2.1.0.odt Page 27/40

• the parameter "CT" of the model configuration file (see next section) is set to 1.

The integration of the Cloud Type class value into the RDT product is done as follows: for a given detected cloud system, the corresponding cloud type is defined as the highest proportion of processed cloud type class over the cell's horizontal extension.

3.3.1.2.5 CMIC product.

In the RDT-CW software, it is possible to document phase (water or ice) and microphysics (Cloud Optical Thickness, Radius effective, Cloud Water Path) of cloud systems detected and tracked by the software. This is done through the integration of the CMIC product of the NWC/GEO into the RDT-CW product. Moreover, micro-physic parameters are used to estimate a high altitude ice crystal risk over the cloud cell extension

This integration is optional. In order to use the CMIC product as input to the RDT-CW software, the user has to ensure that

- The CMIC product is generated on the desired region and that
- The parameter "CMIC" of the model configuration file (see next section) is set to 1.

The integration and use of the micro-physic values into the RDT-CW product is done as follows:

- Cloud Optical Thickness (COT), Liquid Water Path (LWP) and Ice Water Path (IWP) 2D fields are used to determine a 2D temporary field of high altitude ice crystal risk
- For a given detected cloud system, the corresponding cloud phase is defined as the highest proportion of processed cloud phase value (water or ice) over the cell's horizontal extension. The information on phase is given only if the ratio of cloud phase processed pixels is greater than 1/5th of RDT cell's pixels, otherwise it is set to "unknown". It is corrected to "mixed" if the highest proportion of phase value is below 60%, or if this mixed value represents the highest proportion.
- The Cloud Optical Thickness (COT) value corresponds to the highest value over cloud cell extension
- The Radius Effective (Reff) value corresponds to the highest value over cloud cell extension
- The Cloud Water Path (CWP) value corresponds to the sum of the highest value of Ice Water Path (IWP) and Liquid Water Path (LWP) over cloud cell extension
- The High altitude Icing Hazard (HIcgHzd) value corresponds to the highest value (0 or 1) of Ice Crystal risk 2D field over cloud cell extension

3.3.1.2.6 CRRPh product.

In the RDT-CW software, it is possible to document a rain rate of cloud systems detected and tracked by the software. This is done through the integration of the CRRPh product of the NWC/GEO into the RDT product. This integration is optional.

In order to use the CRRPh product as input to the RDT-CW software for evaluating a maximum rain rate attribute, the user has to ensure that

- the CRRPh product is generated on the desired region and that
- the parameter "CRRPh" of the model configuration file (see next section) is set to a value equal or greater to 1.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024
File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection_v2.1.0.odt
Page 28/40

The integration of the convective rain rate value into the RDT product is done as follows: for a given detected cloud system, the corresponding maximum convective rain rate is defined as the 99th percentile of processed rain rate intensity over the cell's horizontal extension.

The convective rain rate is also considered for qualifying RDT cells as "significant", independently of RDT-CW convective discrimination result. The default threshold for that purpose is 30mm/h. It can be customized through parameter "CRRPh" of the model configuration file.

3.3.1.2.7 HRW product

In the RDT-CW software, it is possible to take into account HRW Atmospheric Motion Vectors to process, with U/V NWP winds, a guess for movement field.

This integration is optional. In order to use the HRW product as input to the RDT-CW software for improving the cloud cell motion estimation, the user has to ensure that:

- The HRW product is generated on the desired region and that
- The parameter "HRW" of the model configuration file (see next section) is set to 1.

The use of HRW into the RDT software is done as follows:

- Predictor winds available for the current slot are read in temporary directory of \$SAFNWC
- Those observations are remapped with a defined tolerance onto region definition to fill a movement field
- This movement field is completed from U/V NWP winds read from low-mid NWP levels, where no HRW observations are available

Thus, a guess movement field is made available for cloud cell tracking, which allows a better initiation of cloud cell movement.

3.3.2 Model Configuration File and configurable parameters

The RDT-CW model configuration file, placed in the \$SAFNWC/config directory, contains flags and values required for the processing. The file contains the following information, among which user's configurable parameters are highlighted:

Keyword	Description	Type	Default Value(s)
PGE_ID	Identifier of the PGE	Chain of	RDT-CW
		characters	
SEV_BANDS	SEVIRI channels to be used	Chain of	VIS06 WV62 WV73

Table 5: default RDT-CW Model Configuration File description

- (*) Temperature and relative humidity are requested to be remapped for each pressure level of AV_PRESSURE_LEVELS covering ECMWF and ARPEGE levels.
- (**) Smoothing and dilatation options for advected cloud cells only To be used preferentially in case study mode

3.4 RDT-CW OPERATIONS

3.4.1 Procedure

3.4.1.1 Input data files needed for RDT-CW product generation

- Mandatory input data like satellite data configuration files and auxiliary files as listed in paragraph 3.3.1.1
- Optional input data (NWP, lightning data, other NWCSAF products) as listed in paragraph 3.3.1.2
- PGE configuration file as detailed in paragraph 3.3.2

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date: 22nd February 2024 File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection_v2.1.0.odt Page 31/40

3.4.1.2 Output files obtained from GEO-RDT-CW product generation

GEO-RDT-CW analyzed product and, depending on user's configuration (FCST and FCSTEP arguments in configuration file), forecast products
 S_NWC_RDT-CW_satellite_region-VISIR_YYYYMMDDThhmmssZ.nc
 S_NWC_RDT-CW_satellite_region-VISIR_YYYYMMDDThhmmssZ_0EE.nc
 where EE is the forecast range, in minutes (recommended to be limited to 60)

for example with default configuration for MSG nominal rate S_NWC_RDT-CW_MSGi_region-VISIR_YYYYMMDDThhmmssZ_015.nc S_NWC_RDT-CW_MSGi_region-VISIR_YYYYMMDDThhmmssZ_030.nc S_NWC_RDT-CW_MSGi_region-VISIR_YYYYMMDDThhmmssZ_045.nc S_NWC_RDT-CW_MSGi_region-VISIR_YYYYMMDDThhmmssZ_060.nc in the directory \$SAFNWC/export/RDT

- Depending on user's configuration, intermediate products: S_NWC_CTRAJ_MSGi_region_YYYY-MM-DDThh:mm:ssZ or S_NWC_CTRAJ_MSGi_region_YYYY-MM-DD or S_NWC_CTRAJ_MSGi_region_YYYY-MM by default in in the directory \$SAFNWC/tmp
- Backup files
 GEO-RDT-CW_regionname_Carte_sauvegarde_YYYYMMDDHHmm and
 GEO-RDT-CW_regionname_sauvegarde_YYYYMMDDHHmm in the directory \$SAFNWC/tmp

The following command is used to process GEO-RDT-CW manually, without the presence of the TM:

3.4.2 Examples

GEO-RDT-CW-v523 2015-04-07T12:00:00Z safnwc_MSGN.cfg safnwc_RDT-CW.cfm

This command executes GEO-RDT-CW over the region safnwc_MSGN.cfg manually, without the presence of the TM.

3.4.3 Caution and warning messages

See paragraph 4 for the list of error messages

If everything is correct then the following message is received:

```
CPU time Slot YYYY-MM-DDTHH:mm:ssZ end GEO-RDT-CW : <time> secs
```

3.4.4 Known errors, causes and solutions

None

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection

Page 32/40

3.5 RDT-CW VALIDATION

3.5.1 Summary of validation results

Since Generic Discrimination scheme (GEN mode) may remain active when no calibration has been made available for a given satellite, or depending on user's configuration, previous validation results for v2016 are still applicable.

RDT-CW v2016 subjective validation with case studies or RDT v2011 objective validation and corresponding discrimination skills are detailed in v2016 validation reports, and summarized hereafter:

Considering a moderate electrical activity, the overall probability of detection is 74%, and reaches 77% on convective periods. The start of a convective period is defined on the first lightning occurrence on the convective section. When considering convective cells at single moments, the probability of detection is smaller (65%) but still satisfying whith about 20% of false alarms. Nevertheless, 25% of good detections are detected before the first lightning occurrence, and more than 80% within following 30 minutes.

The tuning of the new Calibrated Discrimination scheme has been undertaken on several geostationary satellites, running GEO-RDT-CW over various geographical regions for several days each. Therefore, the use of a high quality dataset was necessary to be used as ground truth. Meteorage lightning network was used over Europe, GLD360 lightning network over southern part of Indian Ocean, and GOES16/GLM lightning data have been used for RDT operated with GOES16/ABI.

Tuning datasets were submitted to a cross validation process (with independent learning/validation sets). Thus results of calibrated (CAL) discrimination can be considered as reliable and representative. Objective and subjective validation with a limited dataset have been undertaken. Results presented in validation report have to be considered regarding the various geographical regions and various lightning network efficiencies. Objectives scores over a similar domain than GEN validation are at least at the same level.

It has been analysed that RDT-CW provides a convective classification stable in time. The discrimination algorithm is focused on convective periods, is managed through a controlled heritage process to guarantee this stability. The convective systems are de-classified in time during decaying phase, avoiding the tracking of uninteresting objects.

Thus, the RDT provides a right depicting of convective phenomena, from triggering phase to mature stage. The RDT object allows to point out the interest area of a satellite image. It provides interest information on triggering and development clouds and on mature systems. The subjective and objective evaluations exhibit that convection can be sometimes diagnosed before lightning activity occurs.

3.5.2 Known problems and recommendation for user

The tunings have been carried out on a limited set of days for each satellite, with a light to moderate electrical activity with the best dataset available.

The discrimination scores during winter period are weaker.

Warm systems are more difficult to detect.

3.6 EXAMPLE OF RDT-CW VISUALISATION

The final product is numerical data which depict infrared characteristics (spatial and time) and move information associated to RDT cells. Thus, operating the RDT needs a specific visualisation tool.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024

File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection_v2.1.0.odt

Page 33/40

Some specification about RDT visualisation for a tool developed by AEMET has been provided in a scientific report [RD.6.] and can be adapted for some end-users.

The study case below gives an example of a simple RDT operating tool from bulletin-like information only. More elaborate systems with downstream data fusion could take advantage of object approach like these of RDT product.

3.6.1 Example of simple visualization

This visualization is a simple display of RDT-CW on a web page. The background image is satellite infrared data. The different characteristics of convective object are displayed through three steps of visualization:

- The first step corresponds to the superposition of graphical attributes on the corresponding infrared image. These graphical attributes are:
 - At least one coloured contour which defines cloud system edges. The colour of this contour is related to the phase of life of the system which is highly linked to its category (developing, transition, mature) and also to its activity (convective, cooling, expansion ...). A second included contour, with same characteristics, corresponds to a "top of tower" level which has enough different extension than main level.
 - The thickness of this contour is related to the temperature tendency of systems: the greater the cooling, the thicker the contour.
 - The style of the contour (dashed/plain) indicates whether the system is electrically active or not: dashed when no lightning paired or available, plain for lightning occurrence. If –lightning argument of RDT-CW configuration file is >0, the electrical information is used to force the convective diagnostic. When –lightning argument is <0, flashes are paired without impact on convective diagnostic of the cell (visualization tool has to take into account this possibility of "non-detection" of electric cells).
 - A yellow line shows the trajectory of the system (all previous locations of the centre of gravity of the system in past images).
 - A black arrow shows the expected move of the system for the next half hour.
 - One (several) green diamond(s) points the eventual overshoot(s) associated to the system.
- The second step allows to access numerical values of some characteristics of the RDT-CW object. These values are displayed into an interactive popup window. Its visualisation is activated by moving the mouse inside the contour of the corresponding cloud system.
- The third step allows visualizing historical time series of some characteristics. The visualisation of these series, as it was mentioned previously, is interactive and is activated by simple-click inside the contour of the corresponding RDT-CW object:
 - Number of positive and negative lightning impacts registered below the convective system.
 - Area of the system at various brightness temperature thresholds.
 - Threshold temperature and minimum temperature of cell.

Page 34/40

Figure 5: Example of product visualisation, RDT cells on the left, gauge for one cell on the right (pop-up window)

The EUMETRAIN website provides studies cases on convective triggering over France and Africa (http://www.zamg.ac.at/eumetrain/NWCSAF_WS_June2004/Update/main.htm).

3.6.2 Examples of visualisation of forecast products

Figure 6: 11th August 2015 09h00 UTC slot –illustration of RDT advection scheme

The advection scheme takes benefit from an improving quality of cell's motion. It is illustrated in Figure 6, where smoothing and dilatation options have been activated.

Page 35/40

3.6.3 Other examples of visualisation

Météo-France has developed a new visualisation tool, using map web services that provide very light files. Figure 7 exhibits large convective cells over France, an overshooting top is described.

Figure 7: RDT visualisation example with OT depicted near Bordeaux

RDT is also provided to Météo-France forecasters through Synopsis system with various possibility of superposition with other data (Figure hereafter).

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection Issue: 2.1.0 Date: 22nd February 2024 File: NWC-CDOP3-GEO-MF-PI-SCI-UM-Convection v2.1.0.odt

Page 37/40

There are other tools used or developed for NWC SAF products visualisation, for example

- AEMET has developed a real time visualisation tool, on the website http://nwc-saf.eumetsa-tint
- ADAGUC functionalities was also developed by AEMET and has been used for users Testbed

For ESSL TestBed, a html-based data display has been developed to display NWCSAF products.

4 WARNING AND ERROR MESSAGES FOR RDT AND/OR CI

Code (E/ W)	Message including following strings	Comment	Recovery action
Е	"Initialisation error" "Error setting the region"	Error during initialization process when launching PGE	Check arguments and configuration file for launching PGE
Е	"read Error in date format ", "Slot already processed - Task Stopped" "dt ERROR In analyse_recouvrement" , "Pb processing time gap"	Slot time when launching PGE may be wrong.	Check the slot time input when launching PGE. Check or remove backup files in \$SAFNWC/tmp directory for a cold start, or launch for a next slot
Е	"NO_IMAGE_TO_PROCESS" "IMAGE NULL" "read Error Init reading of Satellite Data"	Missing Satellite data	Check \$SAFNWC/import/ Sat_data directory or slot time input
Е	"MALLOC_ERROR" "allocation error" "Unable to allocate", "unable to initialize" "Error allocating" "PB alloc" "not allocated" "ERR NwcMemMalloc" "unable to initialize"	Problem of memory allocation	Check memory
Е	"Error computing lat/lon data"	Bad return status of Nw-cNavGetLatLon routine	Check memory. Contact Helpdesk
Е	"PB NwcProdGetName not OK"	Bad return status of Nwc- ProdGetName routine	Check memory. Contact Helpdesk
Е	"HRW_ERROR_*"	Read problem of HRW pre- decessor winds	Check presence of corresponding files in \$SAFNWC/tmp directory
E/W	"Unable to open", "unable to create", "not found", "PB List2MapObsHrw: TABpixhrw NULL", "FILE_NOT_FOUND", " read", "error reading", "FILE_ERROR", "pb filin", "OPEN_ERROR", "FILE_ERROR", "READ_* error", "write ERROR", "pb access filin", "PB read", "ERROR * Lightning"	Problem to open an existing file or to create a new file, or to read an existing file	Check permission and disk space on the directory. Check presence of the requested file, of the relevant directory. The recovery actions depends on the type of file: for missing configuration files, copy them from delivered SW; for missing file to be input by user: check why they are missing; for new file, check permission/disk space on the directory.
Е	"INITPARAMNWP", "Unable to read the number of available NWP levels"	Pb in initialization of NWP data	Check compliance between nwp_conf_file, NWP parameter in cfm file and NWP data
Е	"NWP_* PB for level"	Missing required data	Check availability of corresponding data/parameter
Е	"PB with BTD of"	Problem for creating memory for image analysis	Check memory. Contact developers on the helpdesk
Е	"dimensions map and imageBTD differ", "imTrendBTD or imageBTD NULL"	Incoherency in image analysis and/or difference	Contact developers on the help-desk.
Е	"PB in BTDimageTrend"	Error when computing trends of channel differences	Contact developers on the help-desk.
Е	"PB in CIpixofiParam"	Error when computing pixel parameters for CI	Contact developers on the help-desk.
Е	"ERROR in Seuillage_MultiT"	Bad return status of thresholding routine	Check other error messages. Contact developers on the helpdesk
Е	« analyse_recouvrement » « In calcul_coupure s »	Incoherency in recovery and spatial analysis	Should not happen. Contact developers on the helpdesk.
Е	"Error due to incoherency in horizontal resolu- tion" "incoherency of size"	Incoherency in spatial resolution or image size.	Should not happen. Contact developers on the helpdesk.

Code: NWC/CDOP3/GEO/MF-PI/SCI/UM/Convection
Issue: 2.1.0 Date: 22nd February 2024

Page 39/40

Code (E/ W)	Message including following strings	Comment	Recovery action
Е	"RDT interrupted after suit_cellules"	Bad return status of tracking routine	Check other error messages and availability of data in \$SAFNWC/tmp directory. Contact developers on the helpdesk
Е	"STOP AdvectionCell NULL target dat " "Error in AdvectionScheme()"	Bad return status of advection routine	Check other error messages. Contact developers on the helpdesk
Е	"Error in *_WriteProduct()", "Error initiating * product for writing", "Error writing * container", "Error finalizing the product"	Bad return status of writing routines	Check other error messages linked to output writing, check PRODIO configuration file. If needed, copy them from delivered SW. Eventu- ally contact developers on the help- desk
Е	"PB READING GENERIC DISCRIMINA- TION_FILE", "DISCRIMINATION NOT POSSIBLE", "INVALID_DISCRIMINATION_DIREC- TORY", "DISCRIMINATION_PROBLEM ReadConvCoeffRegr"	Missing or corrupted coefficient matrix files or direct- ory for discrimination	Check installation content from de- livered SW
W	"cold start"	Run without backup files	
W	"PB Reading previous image" "imAnt NULL"	Previous image missing	Eventually check datas
W	"No HRW obs read"	No available HRW data despite option in cfm file	Check configuration file and/or HRW processing
W	"NWPGuide non successful" "PB NWP_*"	No available NWP data or parameter despite option in cfm file	Check configuration files and/or NWP data
W	"COHERENCE Pb date of image", "Pb restoring datas", "saved and current regions are not the same", "NO_SAVES_FILE", "NO_SAVED_IMAGE", "WRONG DATAS SAVE FILE"	Pb with backup files. Switch to cold start	If necessary stop and re initialize process
W	"imTrendBTD not available"	trend images not available (missing movement field).	
W	"RESTORE_PROBLEM speed"	Incoherence of read parameters	Eventually re initialize process from cold start
W	"MAX_NUM_CELL_TOO_LOW"	Max number of cell exceeded, not taken into account	Eventually reduce region size and/ or thresholding parameters and/or cell area ranges
W	"PB pixel size coord"	Edge pixel => default nom- inal pixel size	
W	"calcul" "incalculable"	Processing parameters not effective => set to missing	
W	"recupere_surfT"	Missing information for vertical description	
W	" no Mvt field", "no external input"	Missing data for processing mvt field	
W	"TOO MANY IMAGES MISSING"	Missing images	Check data flow input
W	"Error computing"	Bad return status of Nw-cNavGetSatAngles or Nw-cNavGetSunAngles routine	
W	"PB enleve_les_cellules_incluantes »		
W	"PB in Parallax correction"	Bad return status of Paral- laxCorrection routine – op- tion desactivated	
W	"PB analyse_recouvrement" "calcul_poids_aval problem", "Pb Calcul_coupures_s", "COHERENCE_PROB- LEM"	problem in group cell recovery	Eventually Contact developers on the helpdesk.
W	"PB READING CALIBRATED DISCRIMINATION_FILE"	Discrimination not calibrated for this satellite	Automatic switch towards generic discrimination scheme. Check installation
