WMO Designated Global Data-processing and Forecasting System Centres

Updated on 24 August 2018

**Hong Kong Observatory
has been designated by
WMO as the RSMC for
Nowcasting since June
2018**

Legend

- | | | |
|---|--|---|
| ★ World Meteorological Centres* (9) | ● RSMC Nowcasting (3) | ☺ RSMCs Non-Nuclear Emergency Response (2) |
| ⊙ Atmospheric Transport Modelling (10) | △ RSMCs TC (6) | ☼ RSMCs Volcano watch services for international air navigation (1) |
| ◇ Global Producing Centres for Long-Range Forecasts (13) | ⬢ RSMCs Sand/Dust (2) | ℞ RSMCs Severe Weather Forecasting (2) |
| + Global Producing Centres for Annual to Decadal Climate Prediction (3) | ▷ Regional Climate Centres (11) | ⚓ RSMCs marine meteorological services (24) |
| ■ RSMCs Geographic (25) | ☢ RSMCs Nuclear Emergency Response (9) | |

* World Meteorological Centres are also Global Producing Centres for a) Deterministic Numerical Weather Prediction, b) Ensemble Numerical Weather Prediction, and c) Long-Range Forecasts.

DESIGNATIONS USED

The depiction and use of boundaries, geographic names and related data shown on maps and included in lists, tables, documents, and databases on this web site are not warranted to be error free nor do they necessarily imply official endorsement or acceptance by the WMO.

Hong Kong Observatory Nowcasting Services

The Hong Kong Observatory (HKO) has been operating its nowcasting services since 1999. In this connection, HKO has developed a suite of nowcasting systems, including the "Short-range Warning of Intense Rainstorms in Localized Systems" (SWIRLS), to aid rainstorm warning operation as well as high-impact weather forecasting for the public and the aviation community. HKO's nowcasting system has been put to use in various WMO Forecast Demonstration Projects and was demonstrated to be among the best performers. In recent years, HKO develops a community version of its nowcasting system (Com-SWIRLS) to promote knowledge exchange in radar nowcasting techniques and for wider application of nowcasting system. HKO is ready to provide nowcasting services to international users in accordance with the standard and requirements for Regional Specialized Meteorological Centre (RSMC) for nowcasting as described in the WMO Manual on the Global Data-Processing and Forecasting System (GDPFS) (WMO-No. 485).

Location-specific Rainfall Nowcast

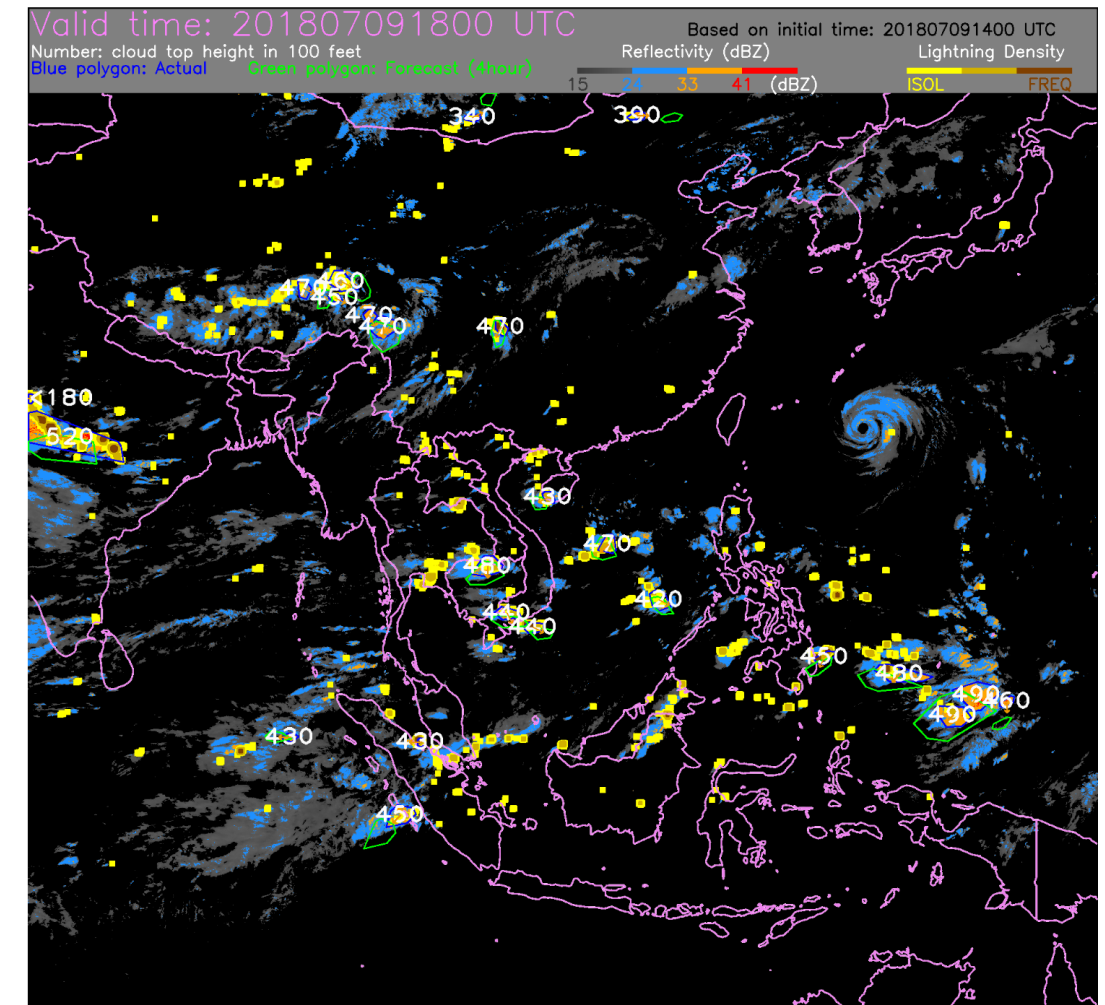

Forecast 4:42 26 Nov 2018

Half-hourly Accumulated Rainfall
Unit: mm

- 20
- 10
- 5
- 2.5
- 0.5

Rainfall and significant convection nowcast products based on HKO's nowcasting systems using radar and Himawari-8 satellite are provided to users on RSMC website

Significant Convection Nowcast over East Asia

Significant convection nowcast at the fourth hour (in UTC) using retrieved reflectivity (blue ≥ 24 dBZ, orange ≥ 33 dBZ and red ≥ 41 dBZ) from Himawari-8 data and updated every 10 minutes. Lightning counts are marked in yellow (sparse) to brown (dense) with green polygons on areas with high reflectivity or dense lightning.

Advanced satellite nowcasting

HKO commenced R&D activities on adapting NWCSAF since 2017 to enhance nowcasting techniques and application of new generation satellite data (Himawari-8/9 and FengYun 4) in support of collaborations with NHMSs, aviation weather services in SE Asia

Repositioning maneuvers of the satellites

According to the repositioning maneuvers of the satellites that will end on March 5 (you can check the movement on the web: <https://www.eumetsat.int/website/home/TechnicalBulletins/Meteosat>), a single configuration file will be sent for each satellite.

You can check the files that will be uploaded in: "Software" > "Software Download" > "NWCSAF/GEO Software Package" (at the bottom of the page)

EXIM Products

Welcome to the NWC SAF

The key objective of the NWC SAF is to provide to National Meteorological Services, Scientific Institutions and in general meteorological users from EUMETSAT member states and worldwide, with an advanced, robust and reliable system to support both operational and research activities in Nowcasting and Very Short Range Forecasting, by means of:

- The production and provision of a software application for the near real time generation of a set of meteorological products to support Nowcasting activities, and
- The provision of support services to final users to allow the maximum exploitation and benefit of the software application and the transfer of knowledge from the NWC SAF consortium to its users.

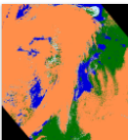

The NWC SAF is being developed by a consortium of National Meteorological Services composed by:

NWC/PPS Products

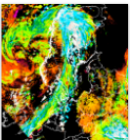

Cloud Products

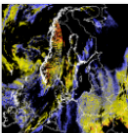

CMA: Cloud Mask

CT: Cloud Type

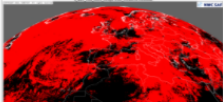

CTTH: Cloud Top Temperature and Height

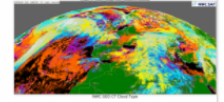

PC: Precipitating Clouds

NWC/GEO Products

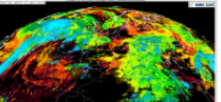

Cloud Products

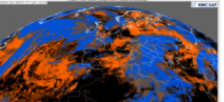

CMA: Cloud Mask

CT: Cloud Type

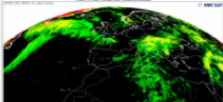

CTTH: Cloud Top Temperature and Height

CMIC: Cloud Microphysics

Precipitation Products

PC: Precipitating Clouds

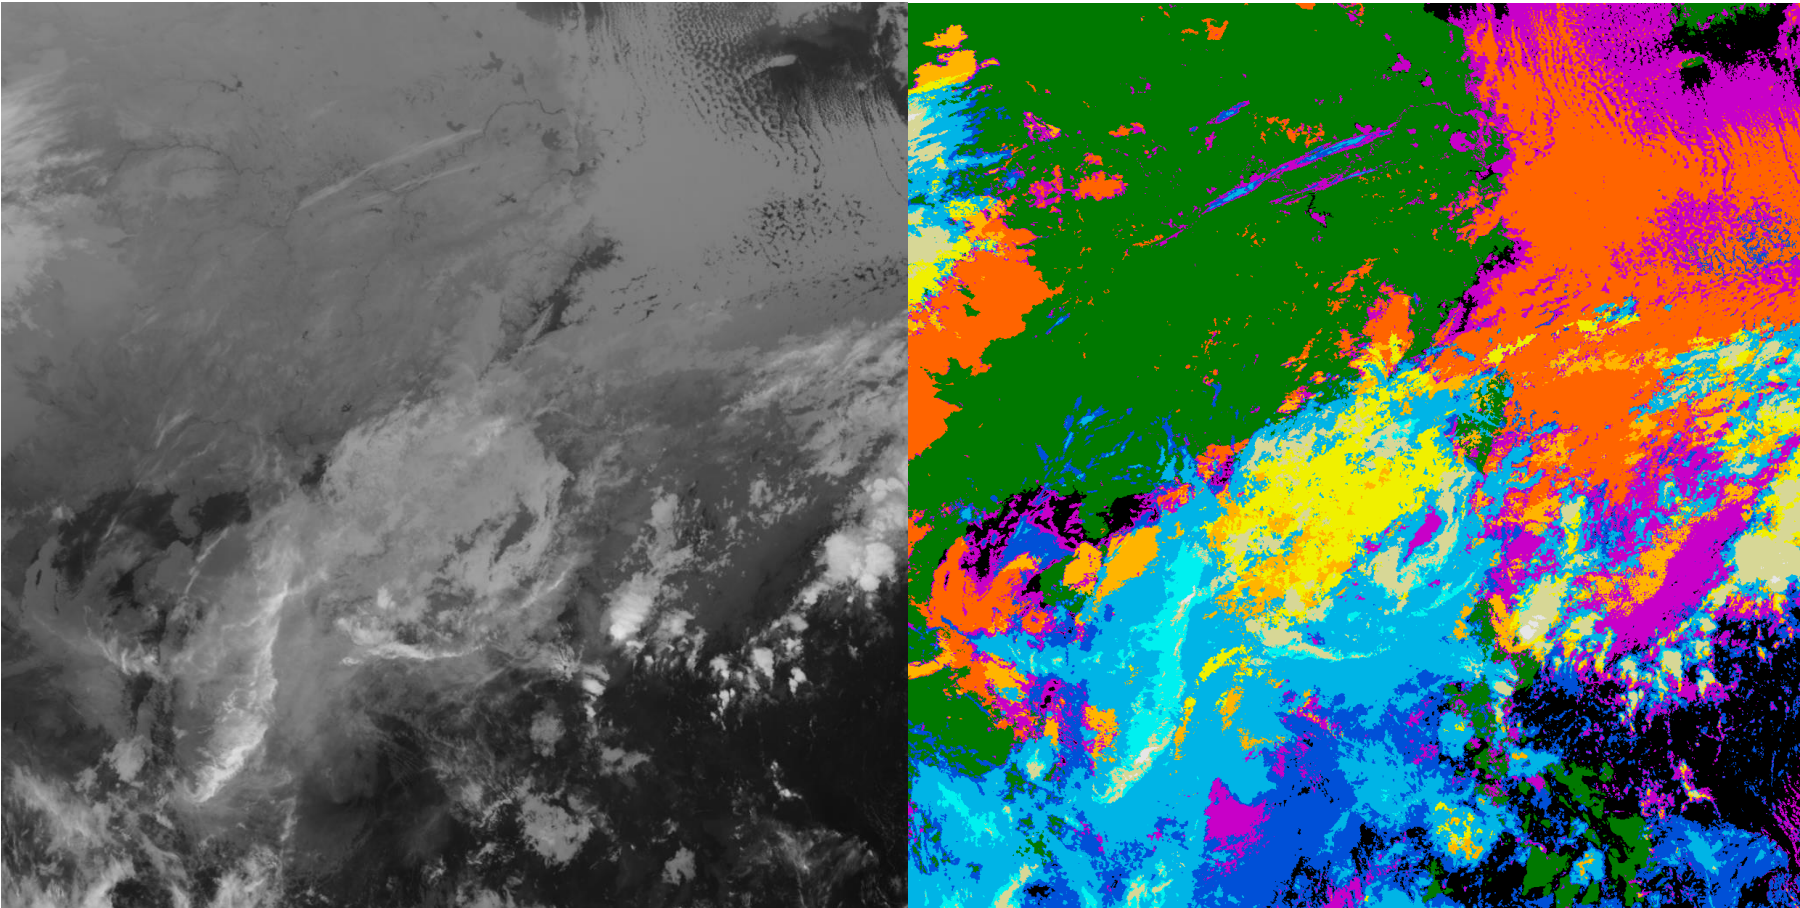

CRR: Convective Rainfall Rate

(PPh) Precipitation Products based on Cloud

Example: 2016-12-27 18:30Z

- High semitransparent above snow/ice
- High semitransparent above low/med clouds
- High semitransparent thick clouds
- High semitransparent meanly thick clouds
- High semitransparent thin clouds
- Fractional clouds
- Very high opaque clouds
- High opaque clouds
- Mid-level clouds
- Low clouds
- Very low clouds
- Sea ice
- Snow over land
- Cloud-free sea
- Cloud-free land

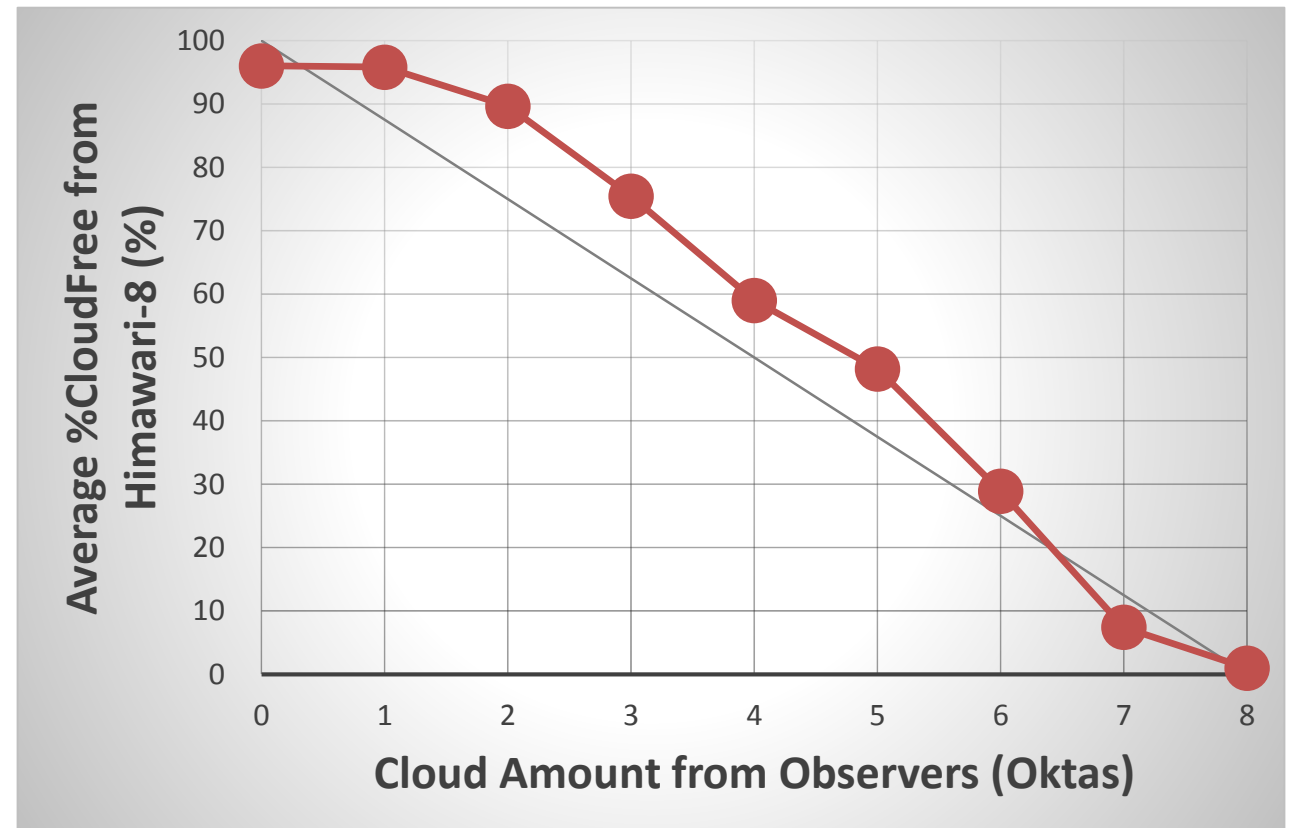

Good performance both in daytime and nighttime
after tuning the threshold tables.

Verification of cloud amount from NWC cloud products

Himawari-8 % of “CloudFree” grid and Observed Cloud Amount

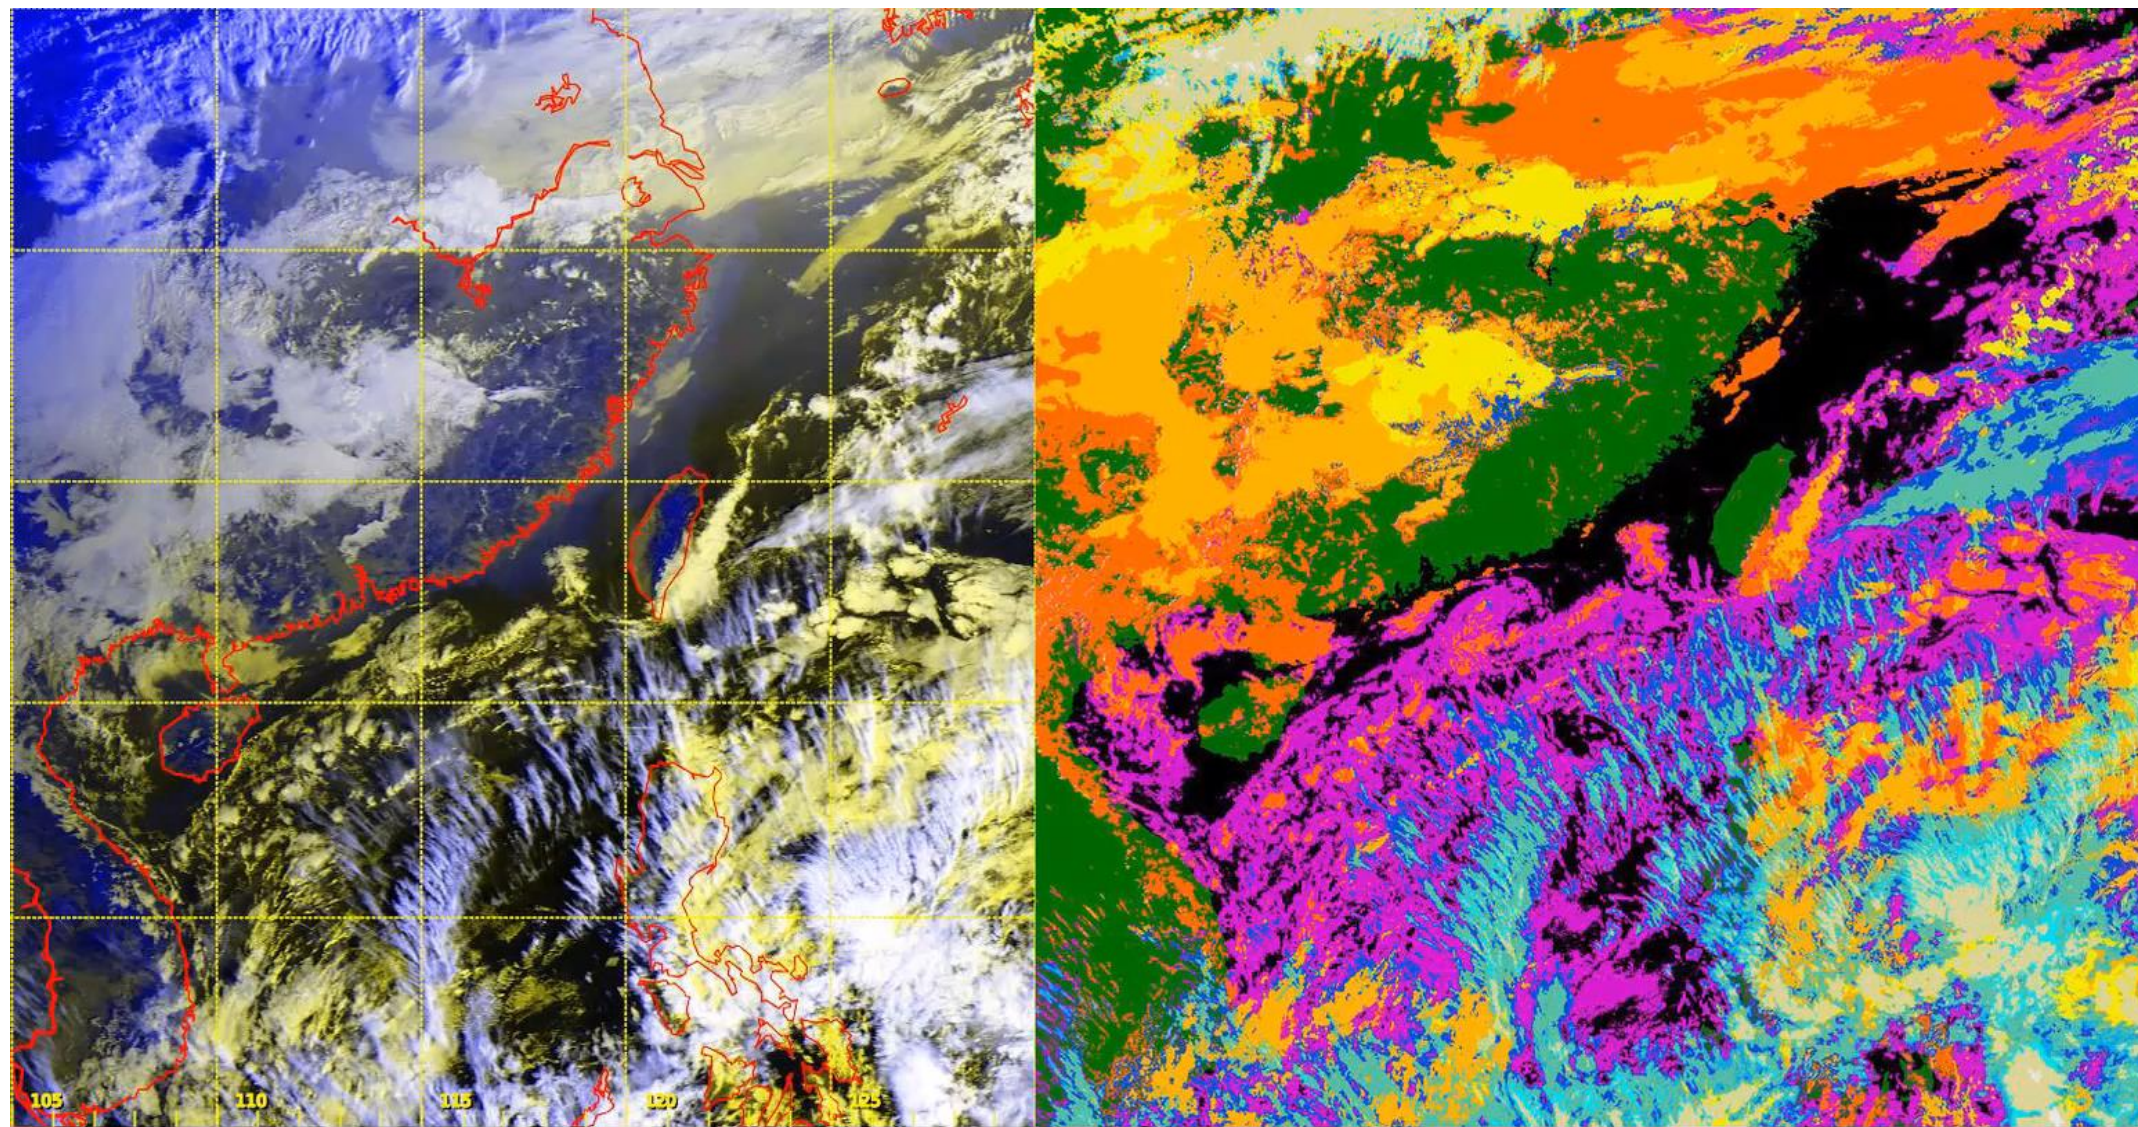

► Data period: ~ 1 years of hourly observed cloud amount at HKO

Cloud Amount from Observers	Average %CloudFree from Himawari-8
0 oktas	96.03%
1 okta	95.82%
2 oktas	89.65%
3 oktas	75.44%
4 oktas	59.00%
5 oktas	48.19%
6 oktas	28.91%
7 oktas	7.44%
8 oktas	1.00%

Cloud Type loop from 2017-02-17 00:00Z to 2017-02-18 23:50Z

Captured very well the Kelvin wave associated with the easterly airstream along the coast of southeastern China that travelled for thousands of kilometers!

Convection Initiation and Rapid Developing Thunderstorm using Advanced Himawari Imager (AHI) data

(A) Convective Initiation (CI) Nowcasting

Group	CI Parameter
Cloud-top glaciation	IR10.8 Brightness Temperature
Cloud-top glaciation	Time spent since crossing freezing level
Cloud-top glaciation	IR10.8-IR8.7
Cloud depth / height	WV6.2-IR10.8
Cloud depth / height	IR13.4-IR10.8
Cloud depth / height	IR12.0-IR10.8
Cloud depth / height	WV6.2-WV7.3
Cloud growth	Change rate of IR10.8 Brightness Temperature
Cloud growth	Change rate of (WV6.2-IR10.8)
Cloud growth	Change rate of (IR10.8-IR8.7)
Cloud growth	Change rate of (IR12.0-IR10.8)
Cloud growth	Change rate of (IR13.4-IR10.8)

Empirical
Rules on
CI

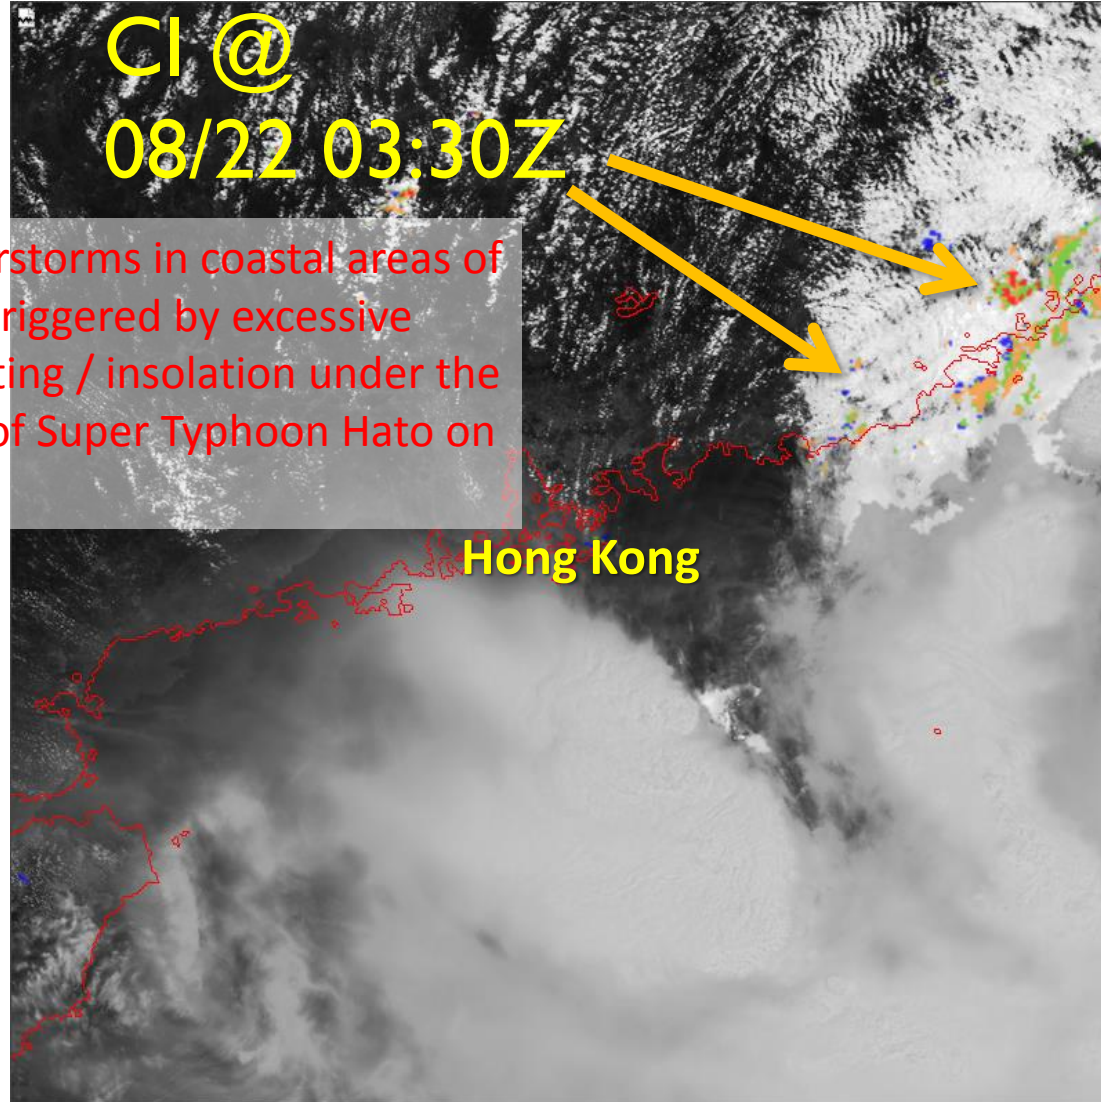

Probability of Convective Initiation in the next 30min

0	Zero probability to become thunderstorm
1	Very Low probability
2	Low probability
3	Mod probability
4	High probability

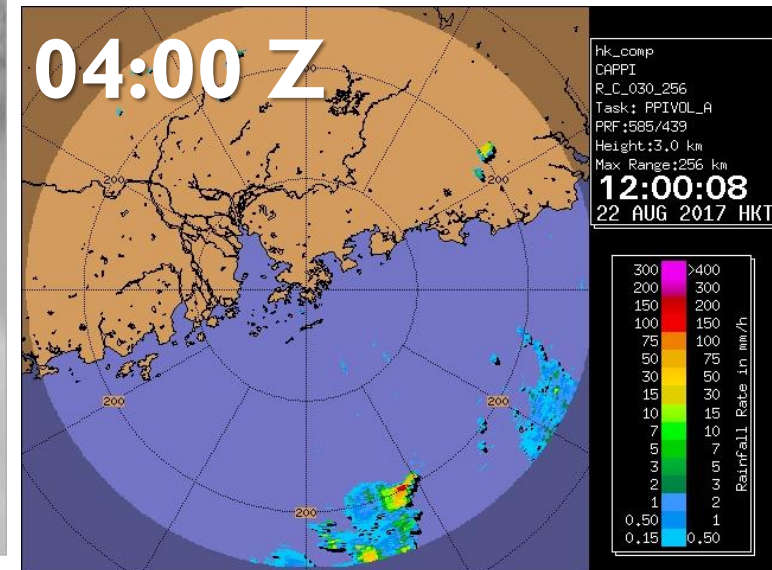

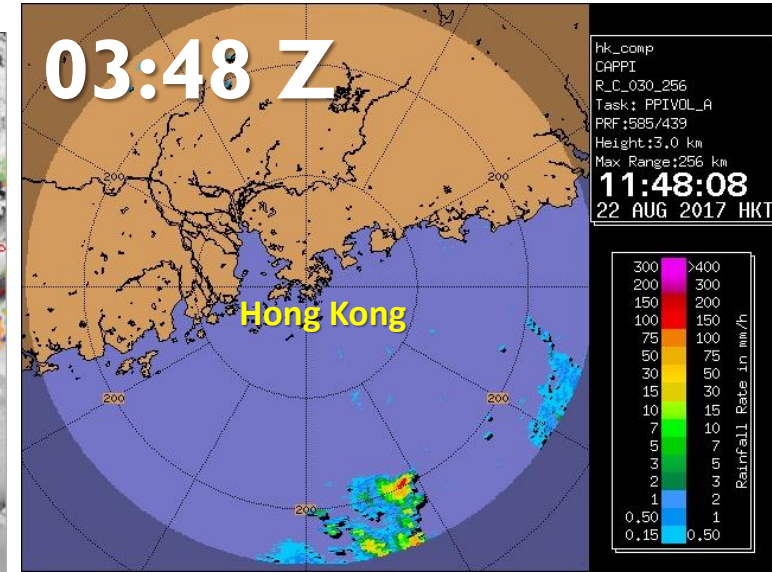

(B) Rapid Developing Thunderstorm – Convective Warning (RDT-CW)

- Analysis to identify intense or rapidly developing convective cloud cells
- Cloud-free pixel → Cloudy → CI → RDT-CW

Convective Initiation

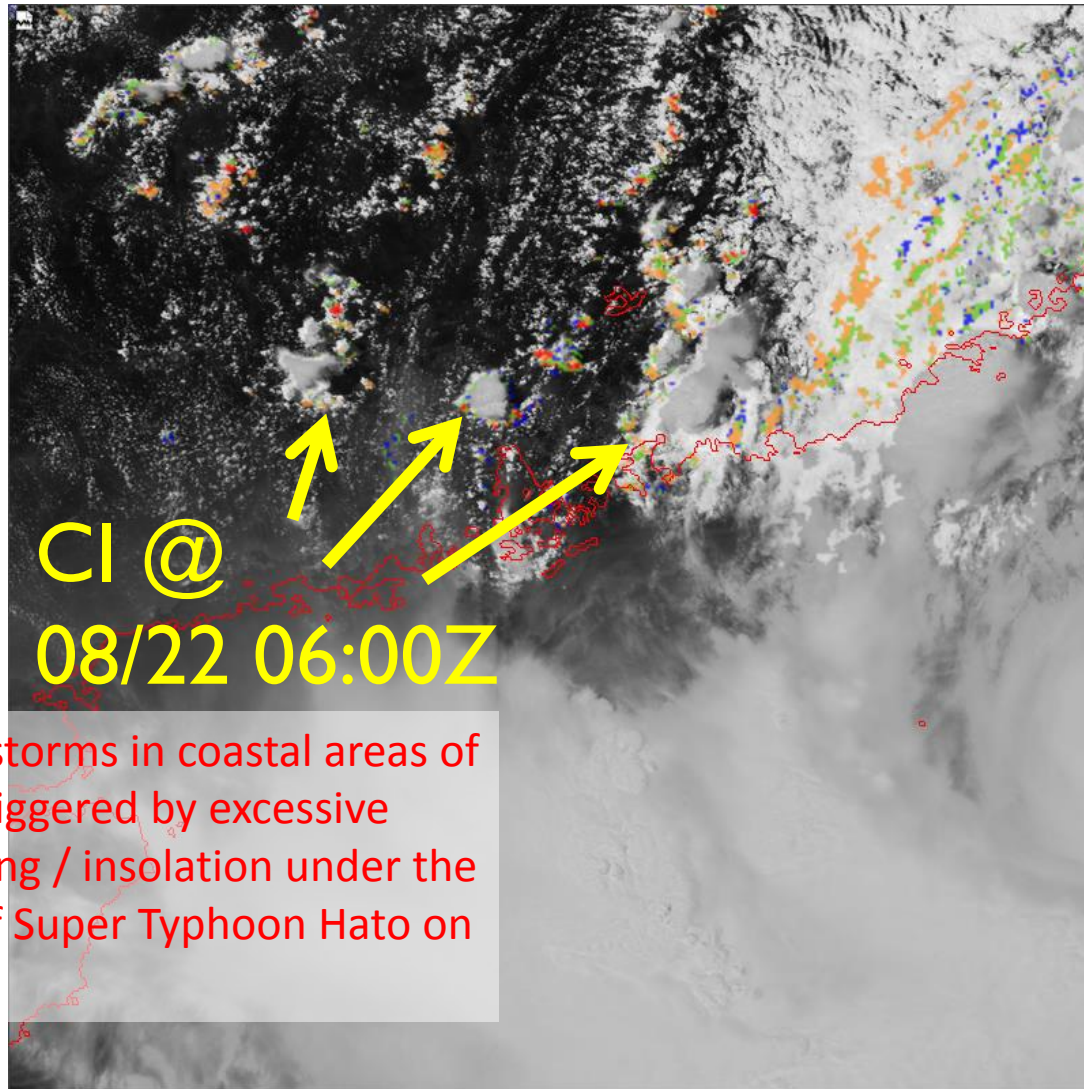

Heat thunderstorms in coastal areas of Guangdong triggered by excessive daytime heating / insolation under the subsistence of Super Typhoon Hato on 22 Aug 2017

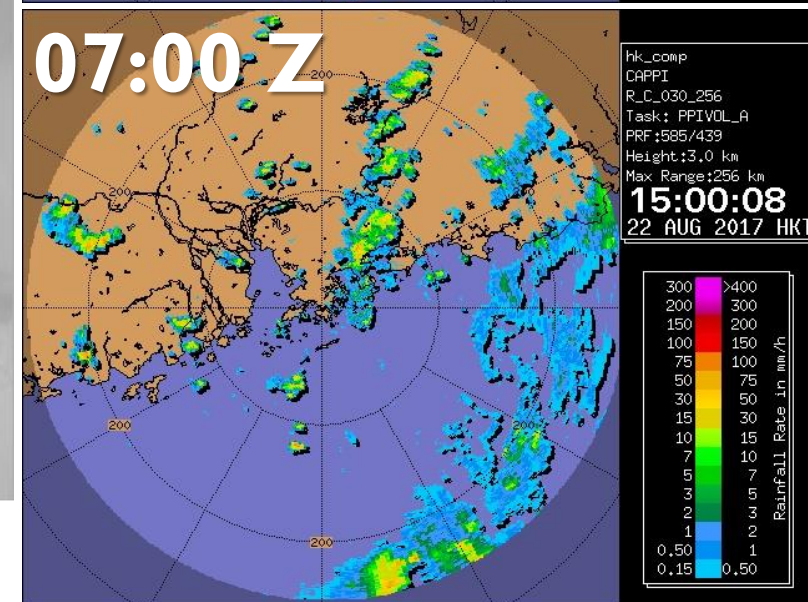

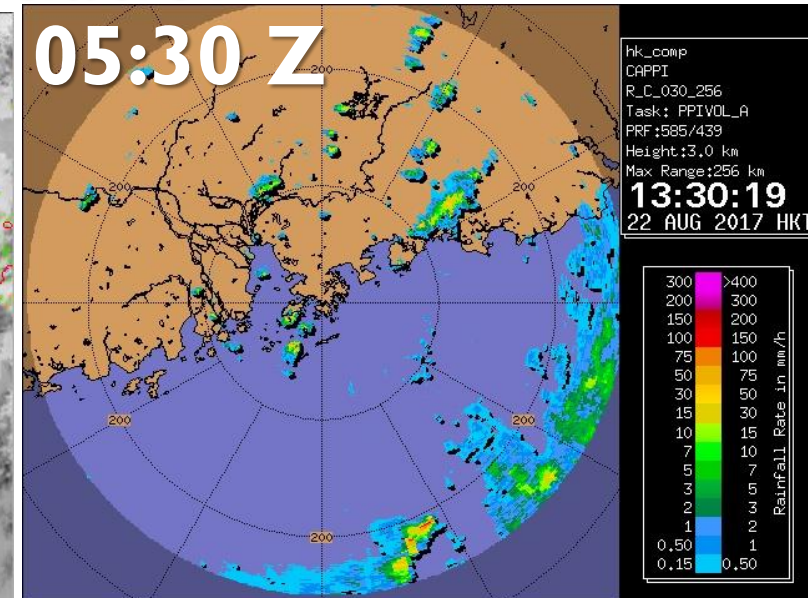

20170822 0330 Z

20170822 1240 Z

16:10 UTC 23 August 2017

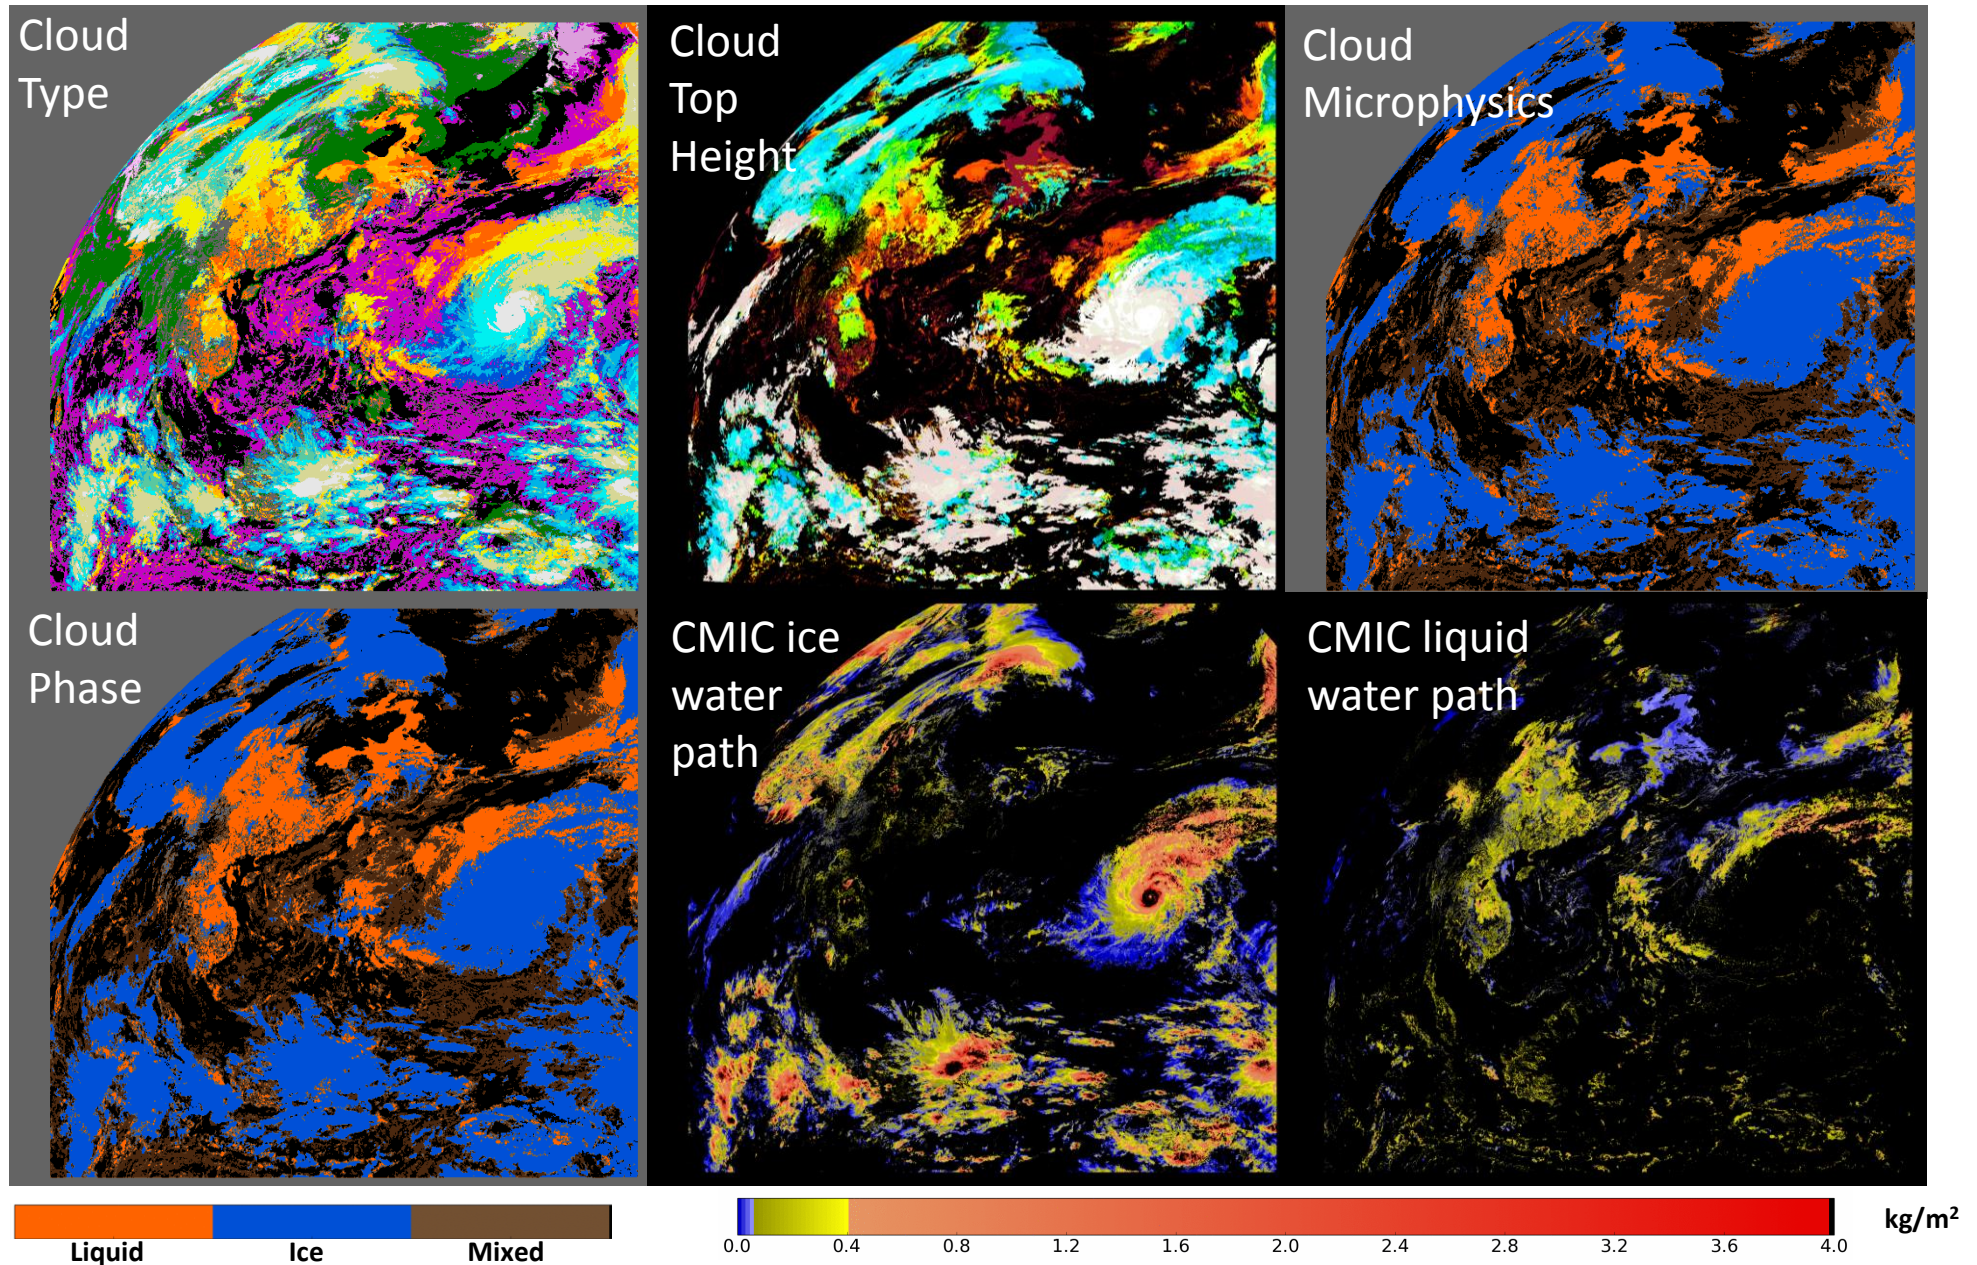

20170822 1610 Z

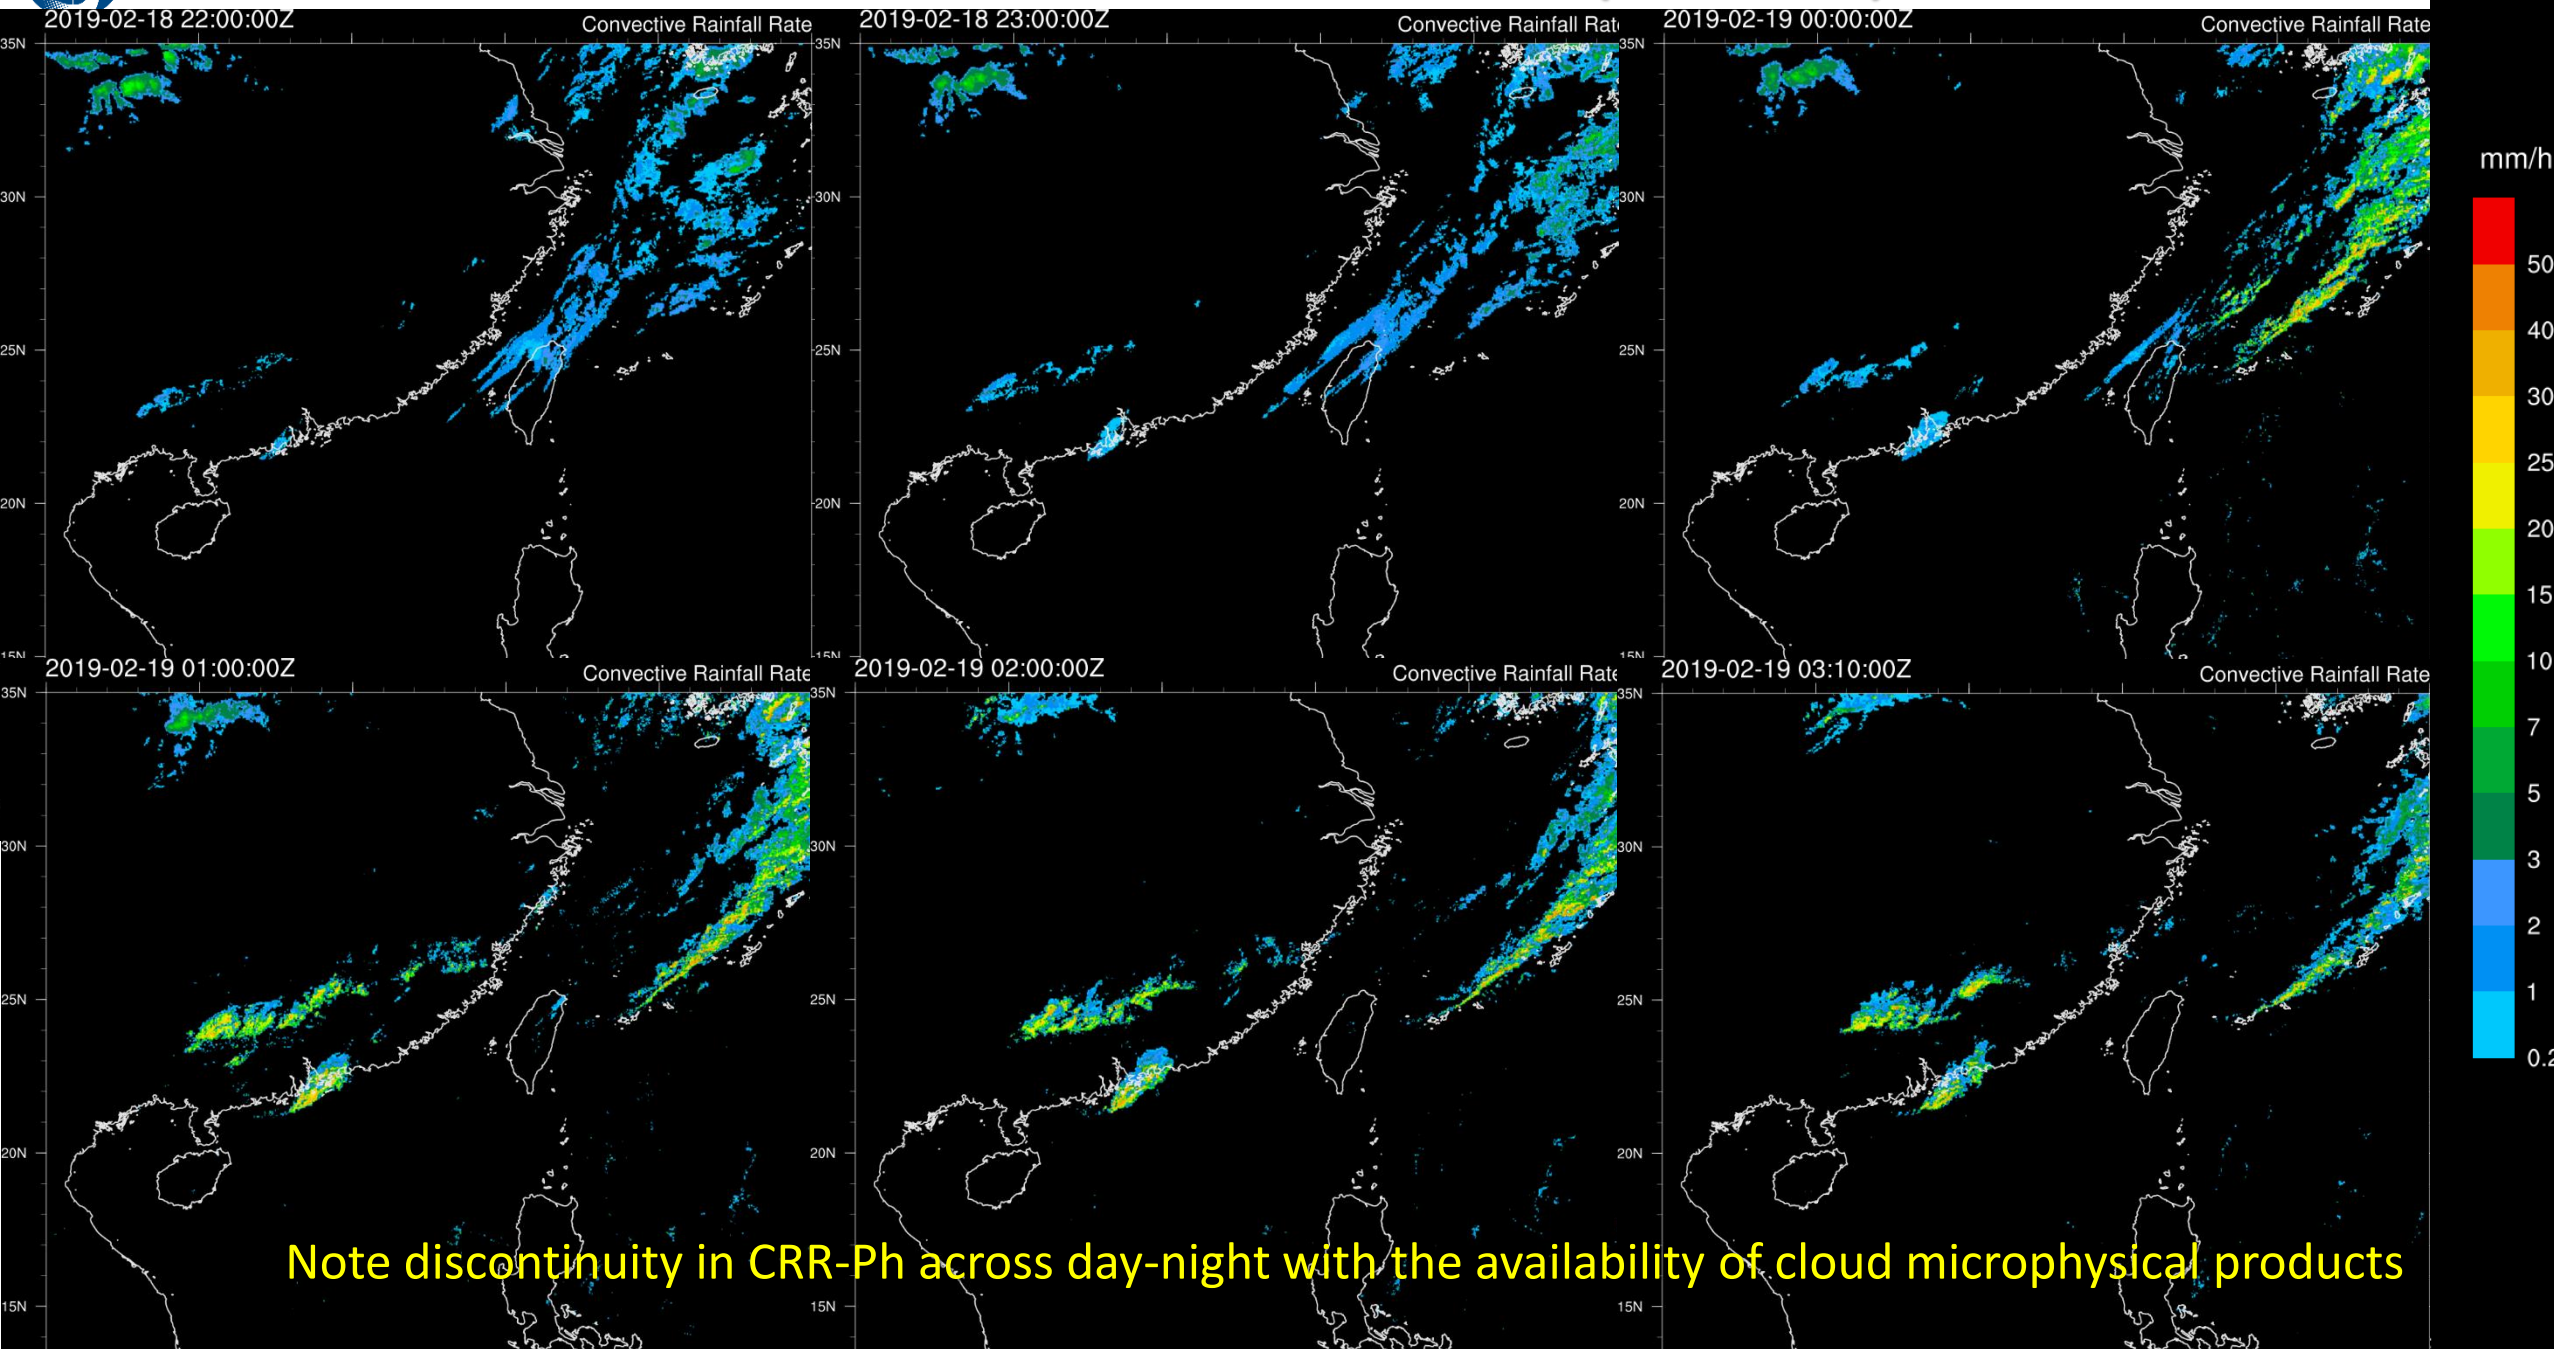

Real-time NWC SAF over East Asia region based on GEO-v2018

20180330 06:00Z

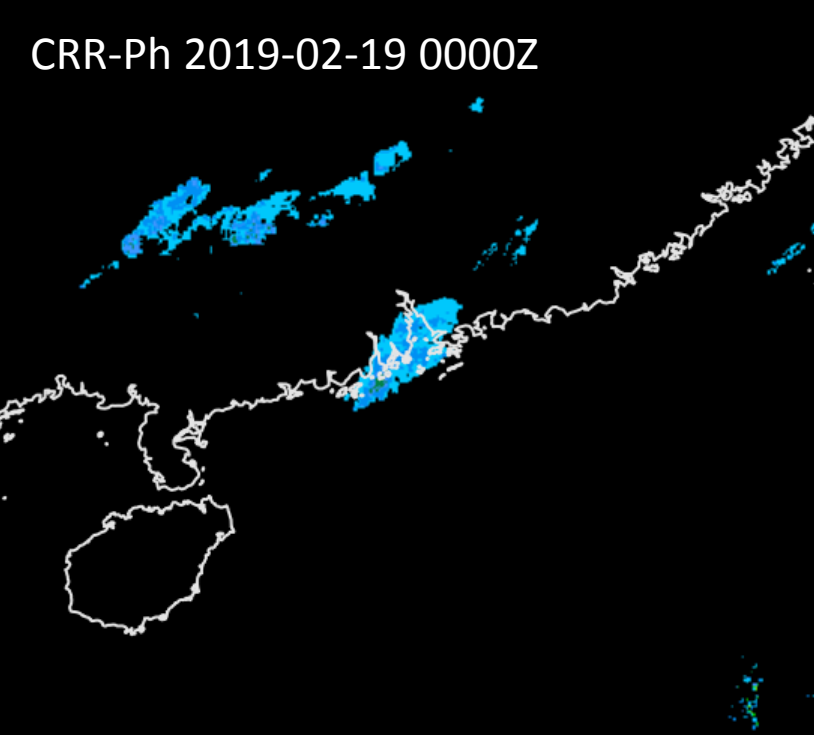

Potential application of the cloud microphysics product on the determination of precipitation rate and storm growth and development being explored.

Convective Rainfall Rate (CRR-Ph)

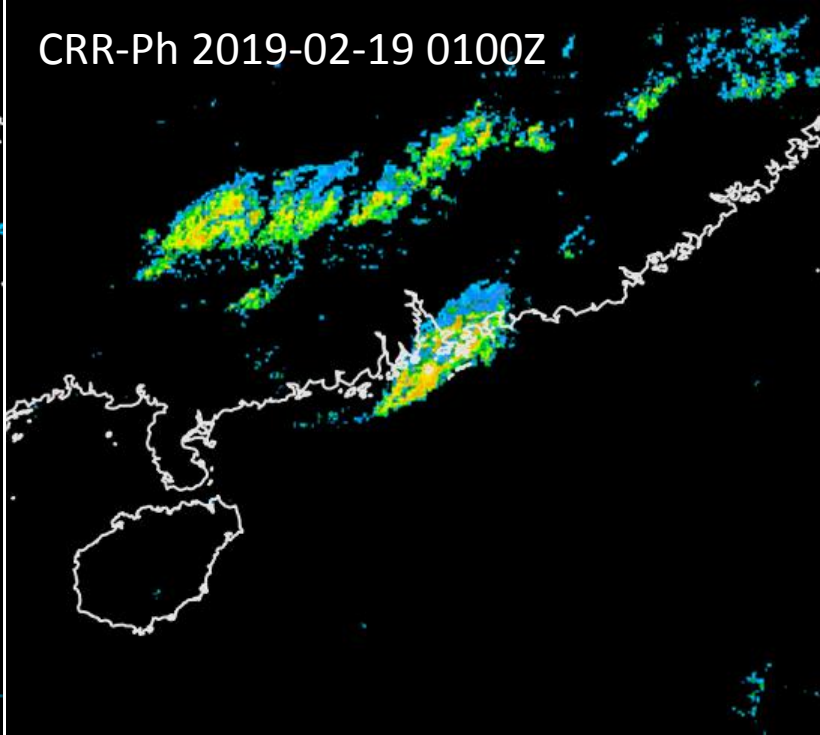

Note discontinuity in CRR-Ph across day-night with the availability of cloud microphysical products

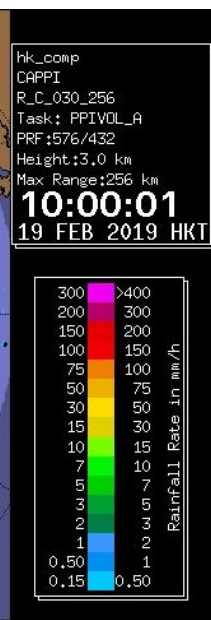

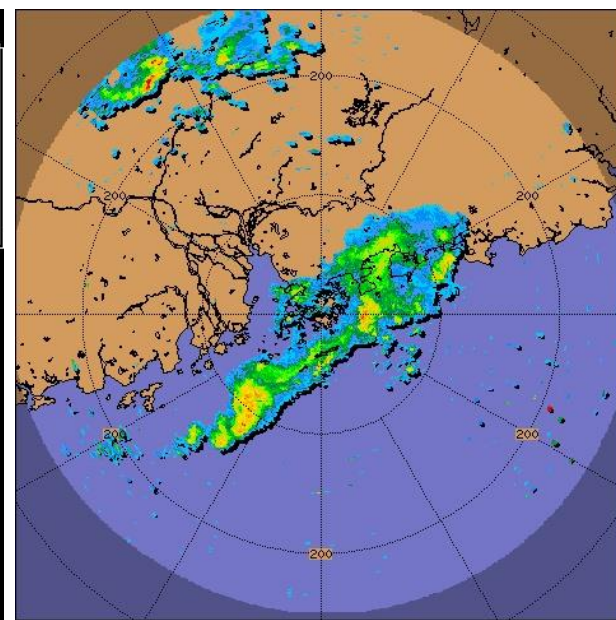

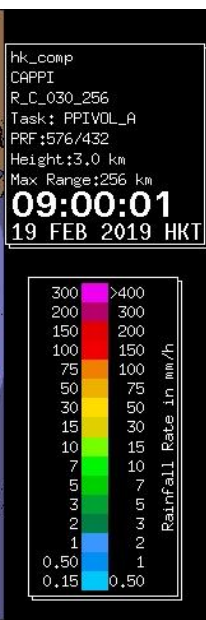

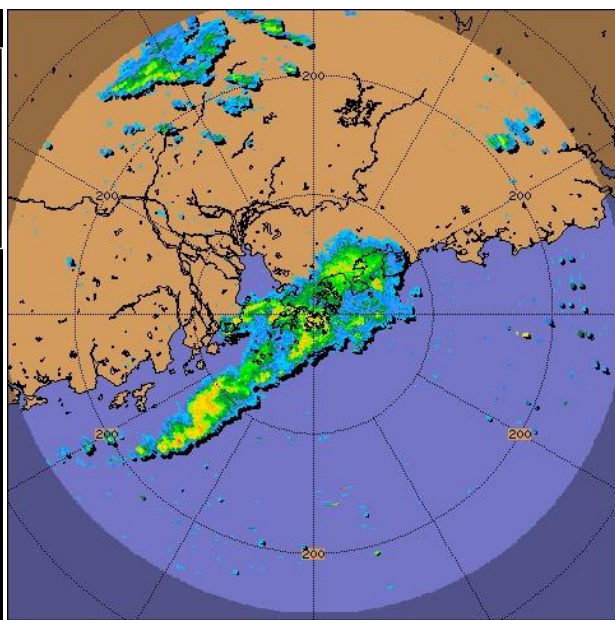

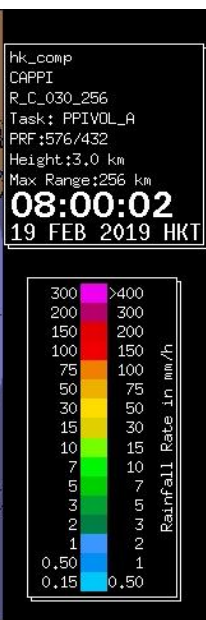

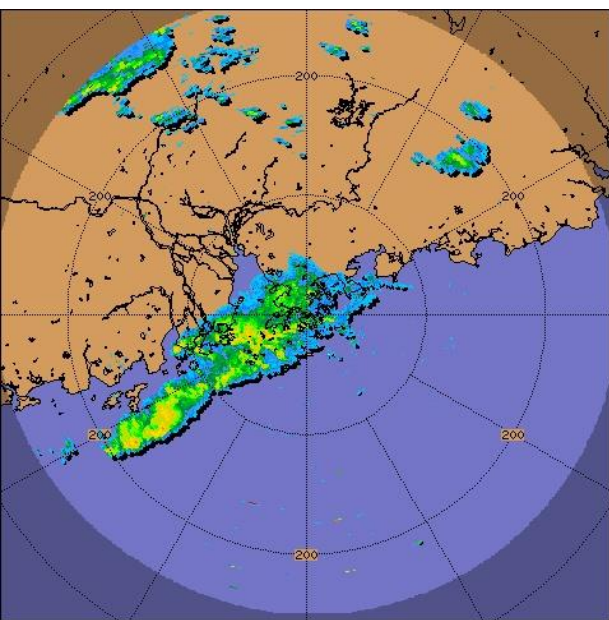

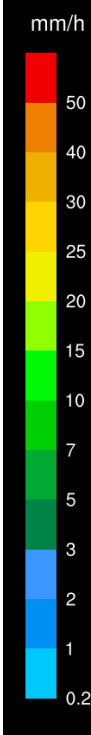

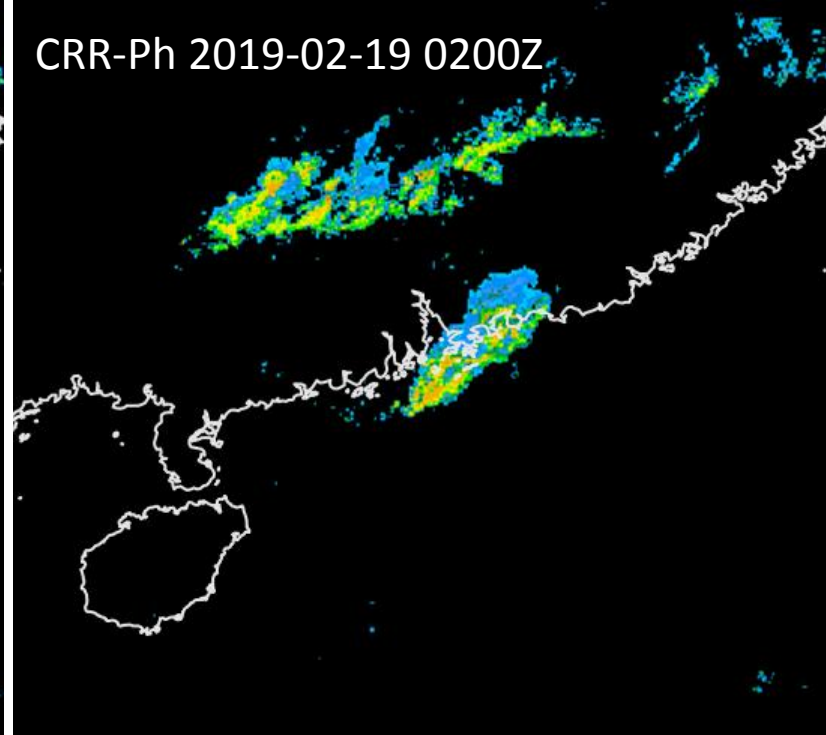

CRR-Ph 2019-02-19 0000Z

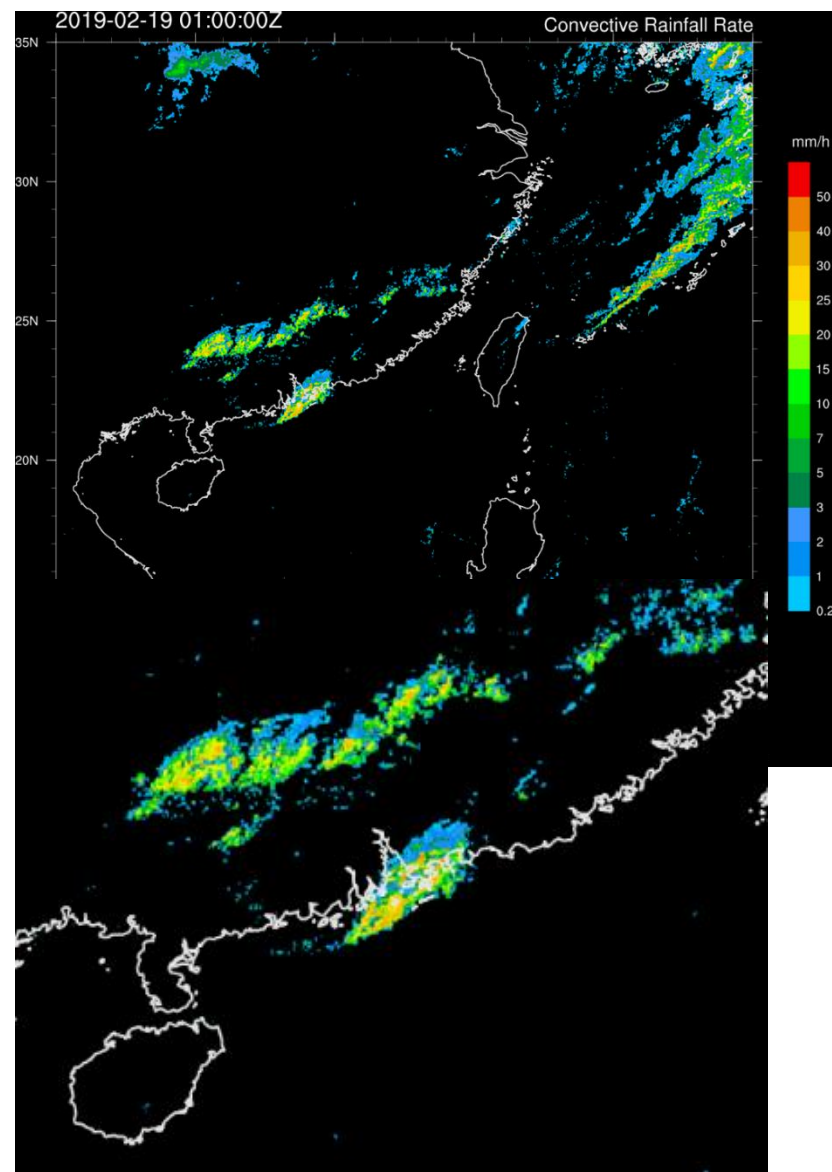

CRR-Ph 2019-02-19 0100Z

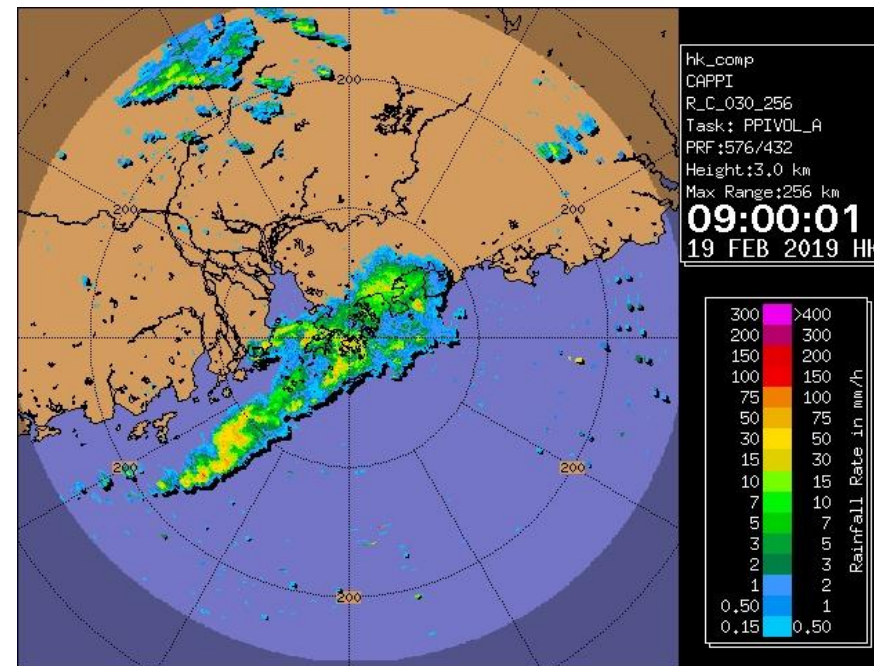

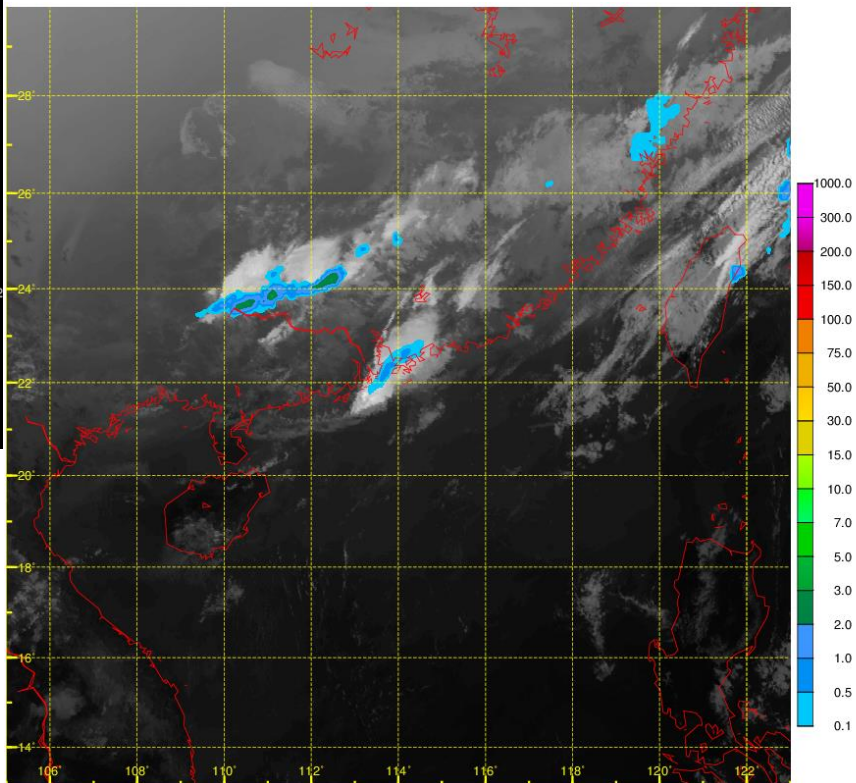

CRR-Ph 2019-02-19 0200Z

CRR-Ph vs QPE (GPM+IR) and radar

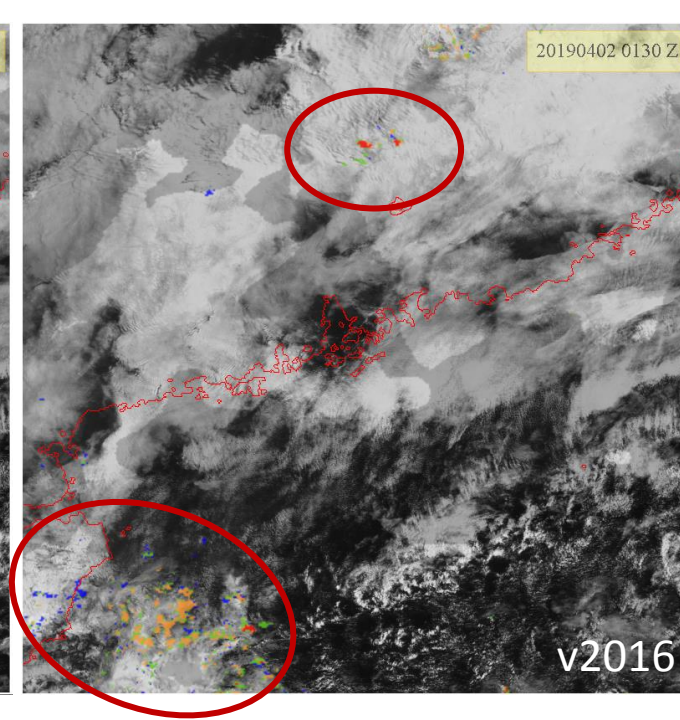

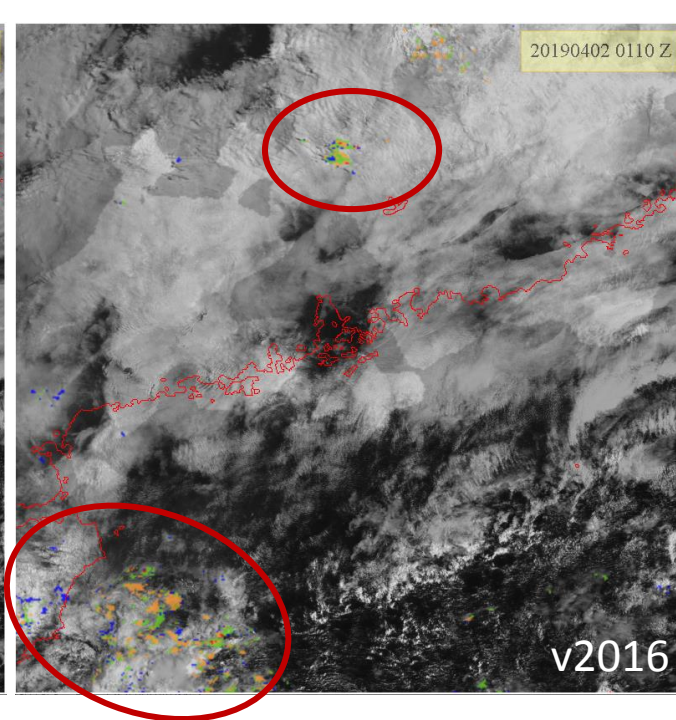

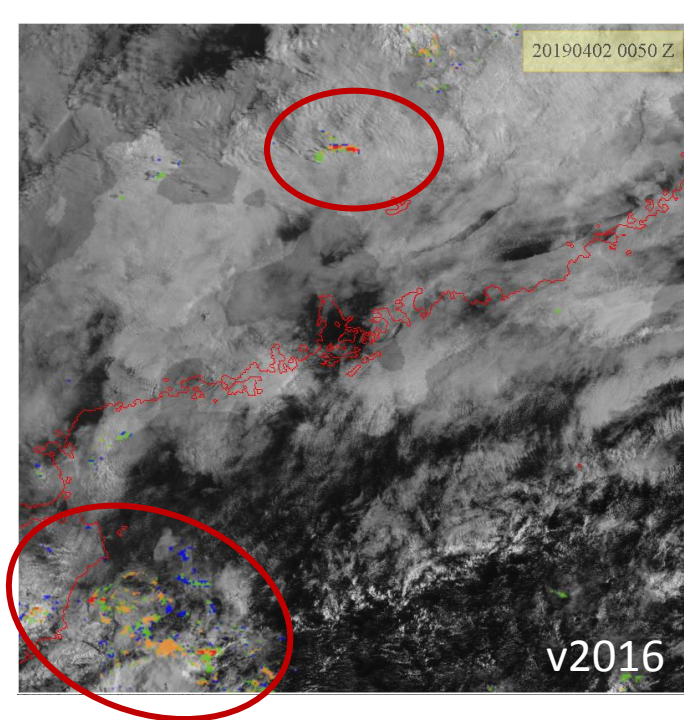

QPE (JAXA)

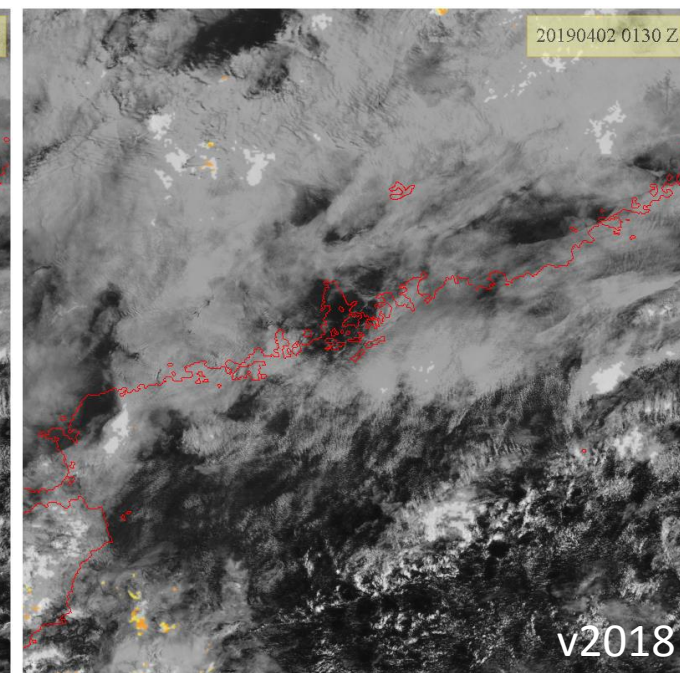

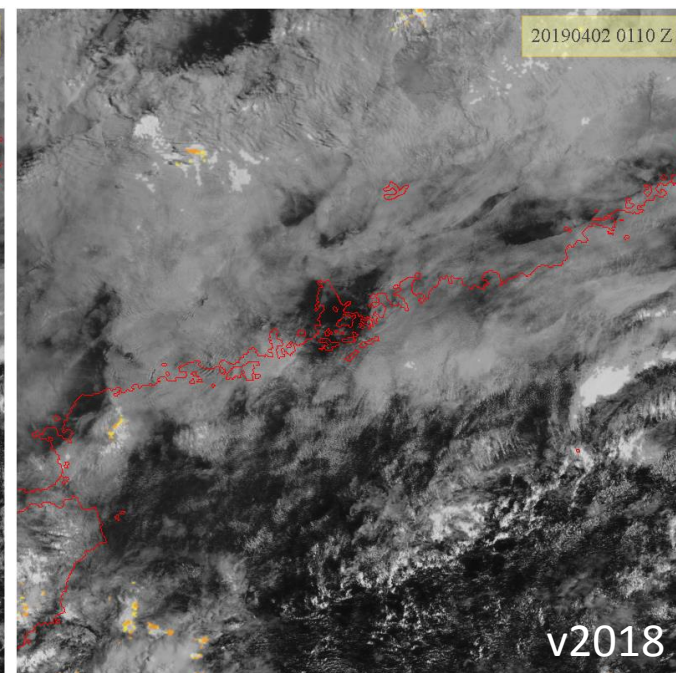

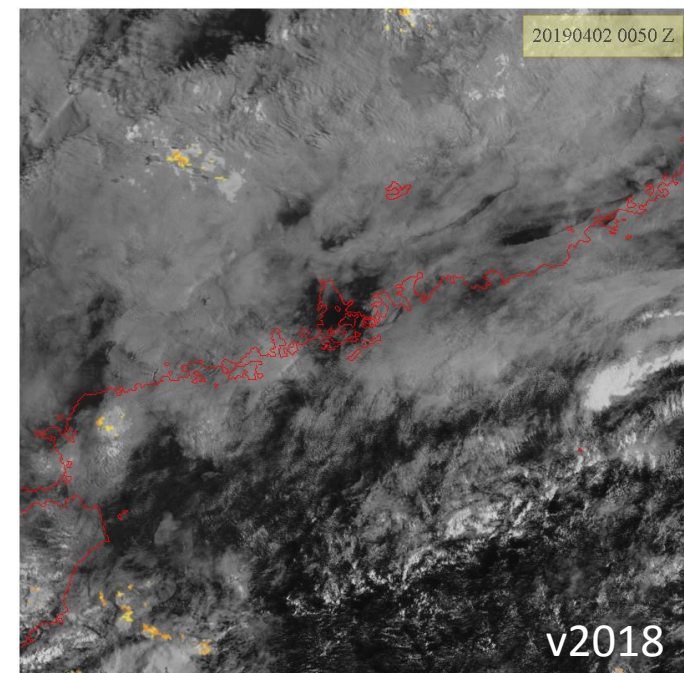

Improvement in the new version of CI

- Improved masking using microphysics (CMIC, daytime only) and cloud type (CT)
 - Use of cloud top phase, cloud optical thickness, liquid water path and ice water path as additional filters to focus on the relevant areas.
 - Use of cloud type to filter out those low clouds which are superimposed with thin cirrus. Significant improvement for the multi-layer issue.
- Differentiate the thresholds for daytime and for nighttime, depending on the availability of CMIC mask
 - Stricter rules when the CMIC mask is not available
- Cloud cell tracking improvement
- The ability to extrapolate the CI pixels up to T+30/60/90 min
- Stricter CI diagnosis rules to reduce false alarm and better highlight areas of high probability
 - Less “noisy” than the previous version
 - New color scale to highlight areas of interest

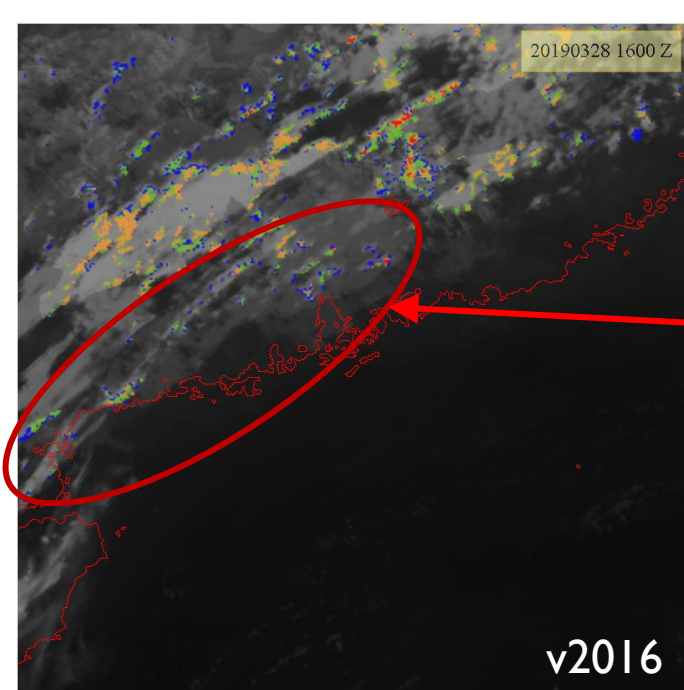

v2016	
0	No Prob
1	VLow
2	Low
3	Mod
4	High

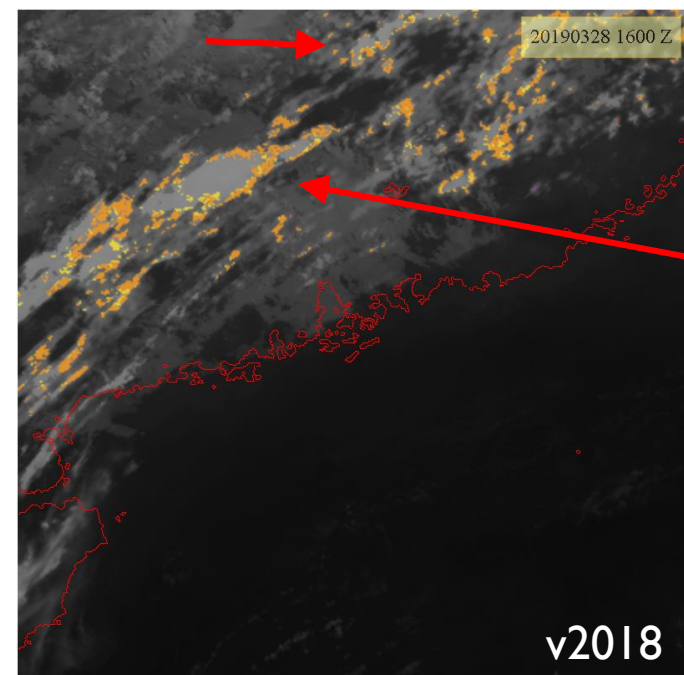

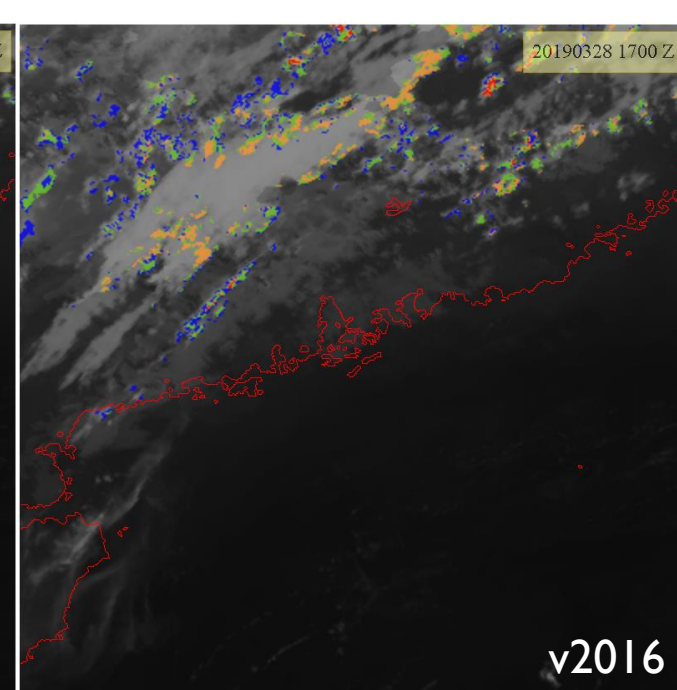

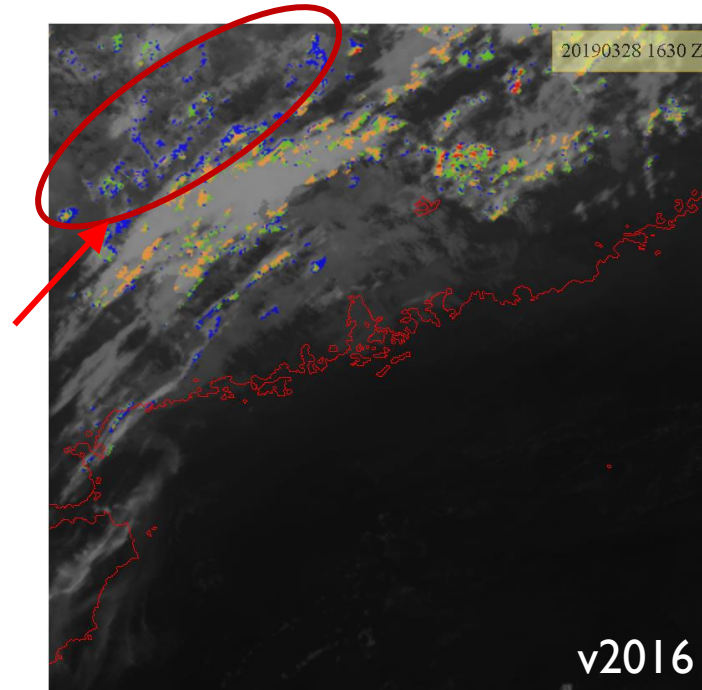

Much less false alarm
in NWCSAF v2018

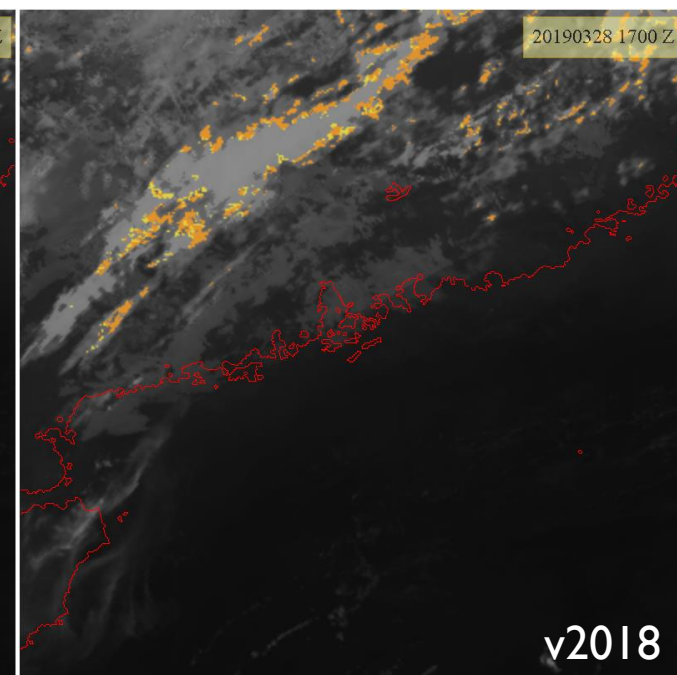

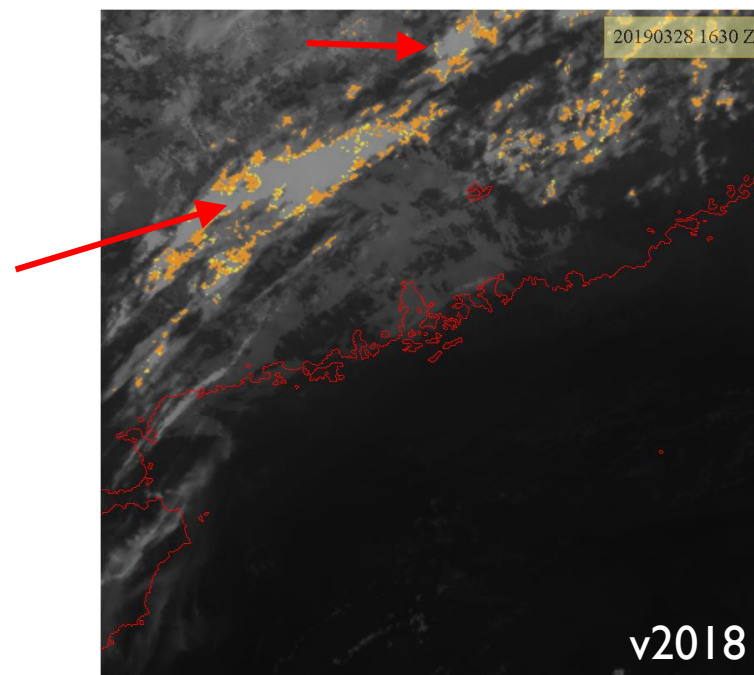

v2018	
0	No Prob
1	VLow
2	Low
3	Mod
4	High

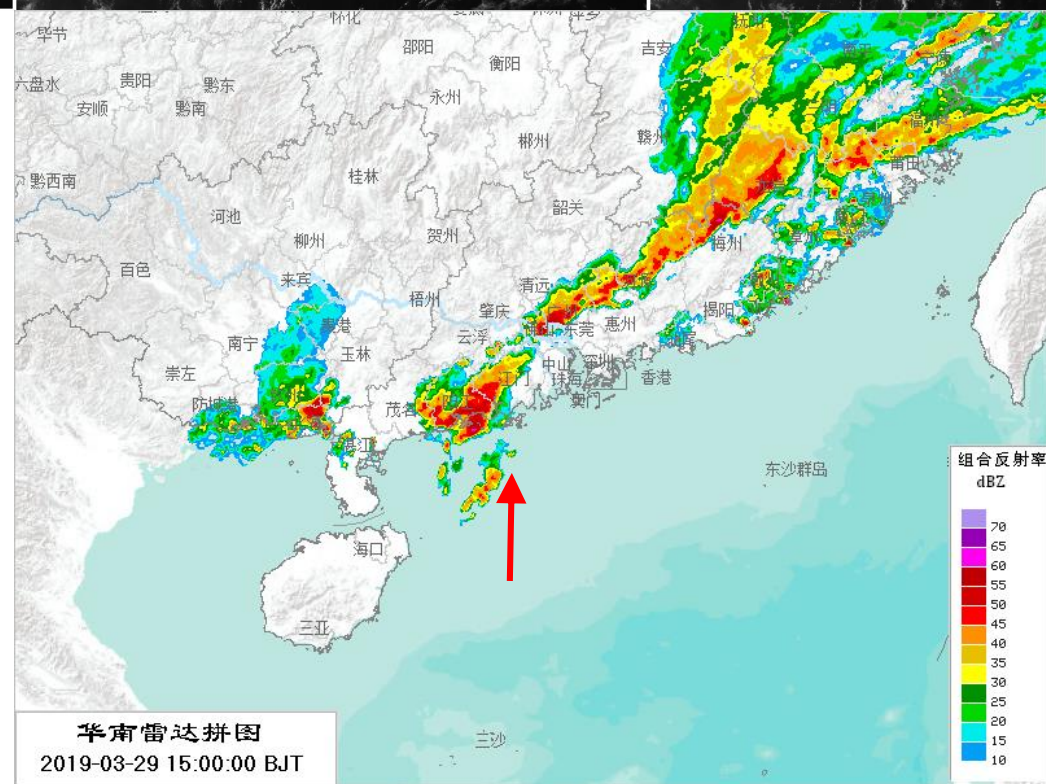

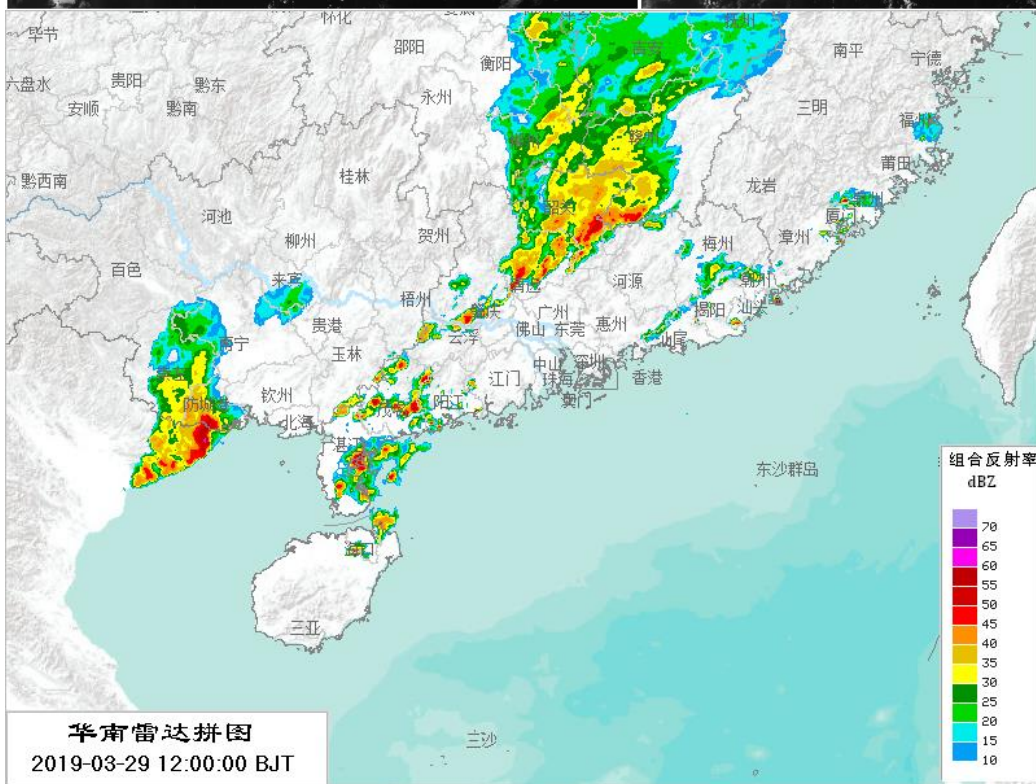

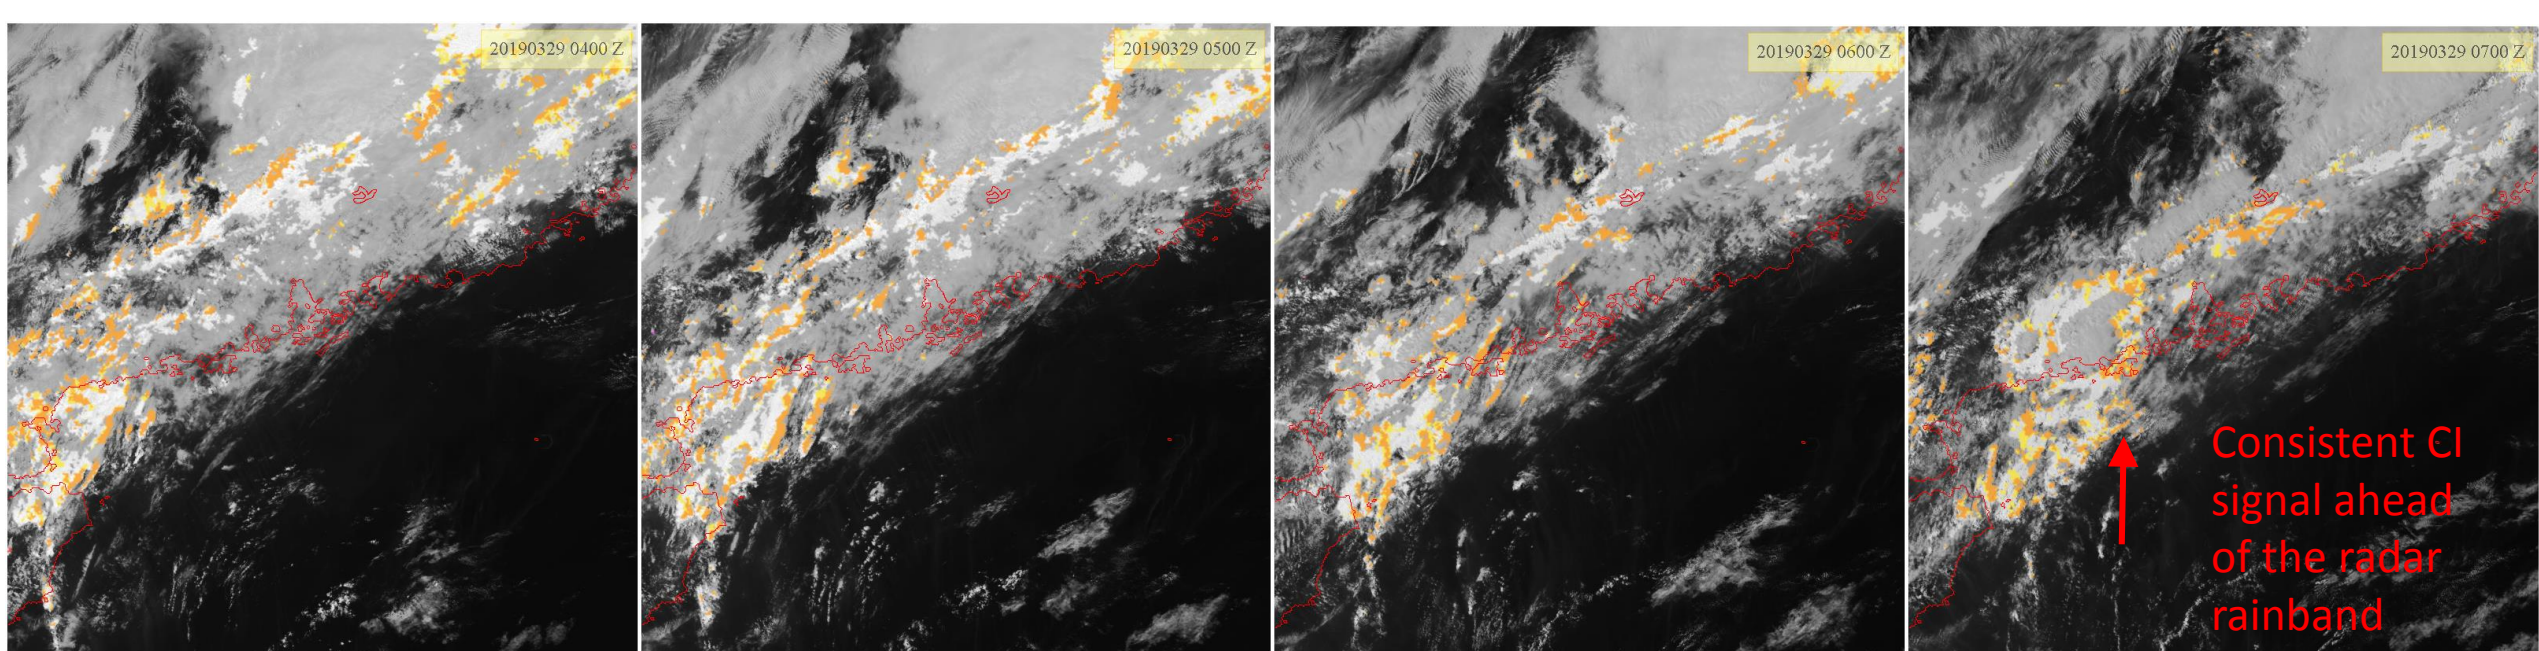

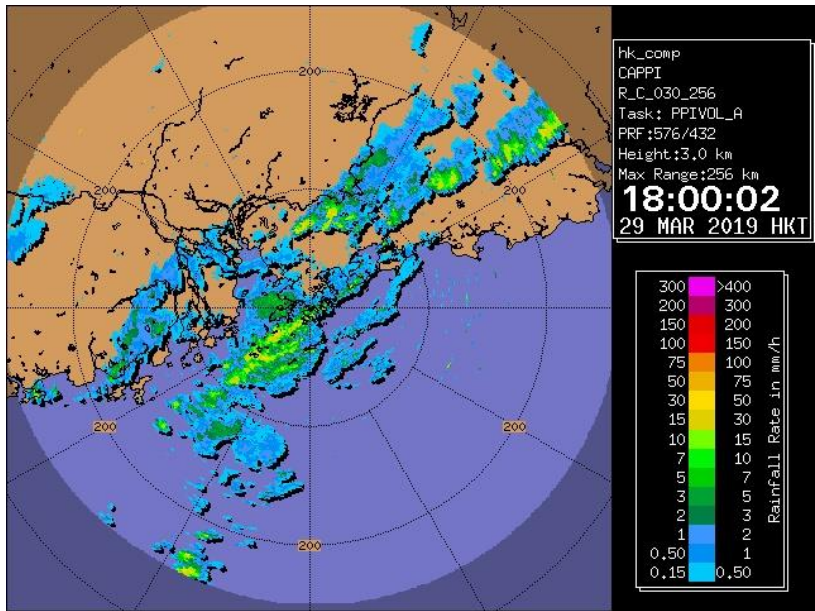

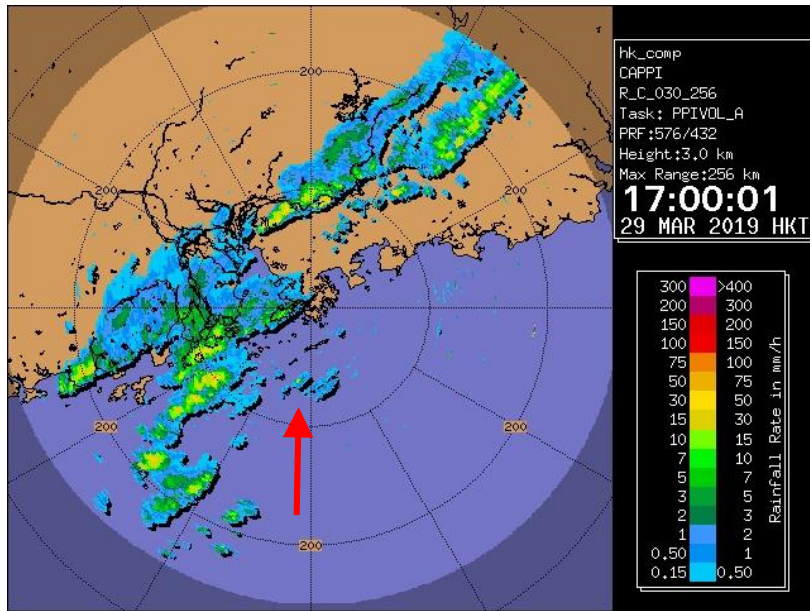

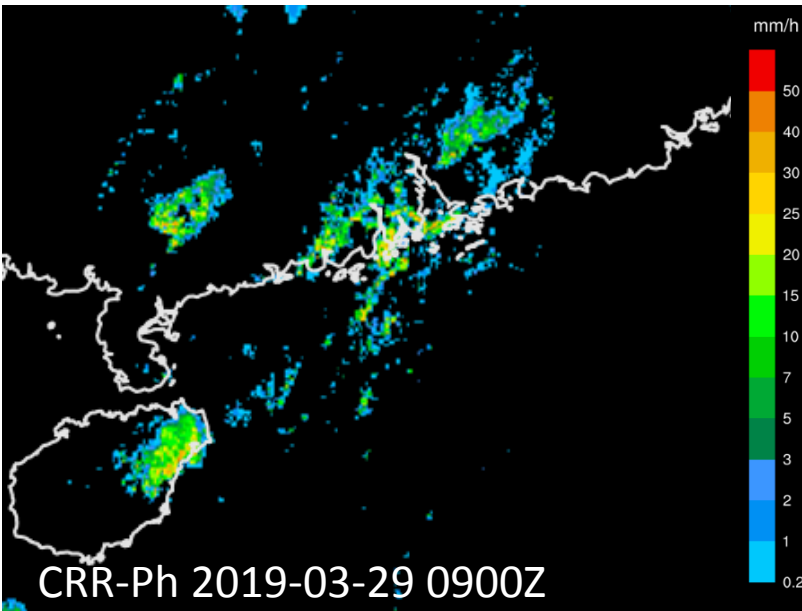

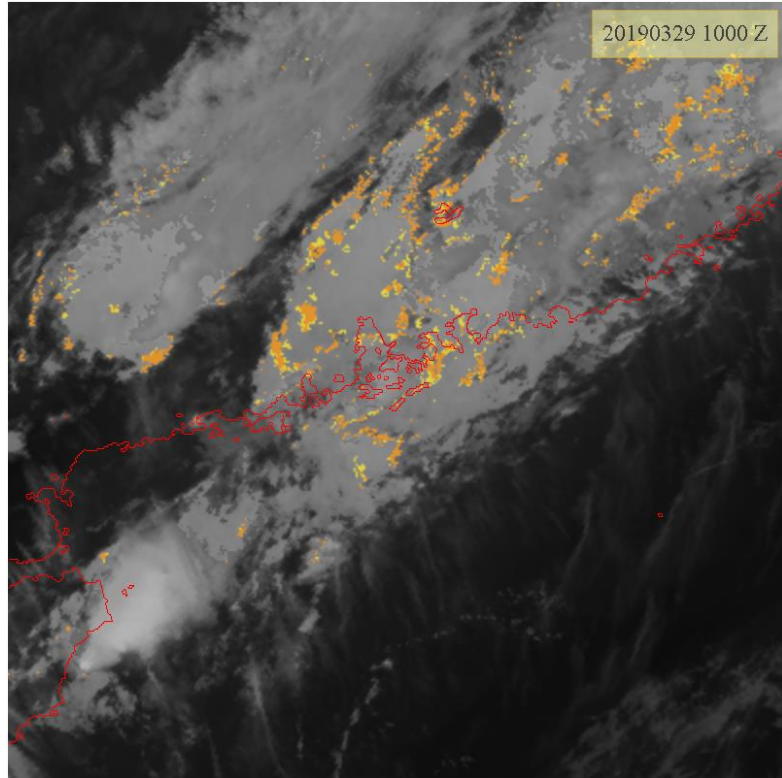

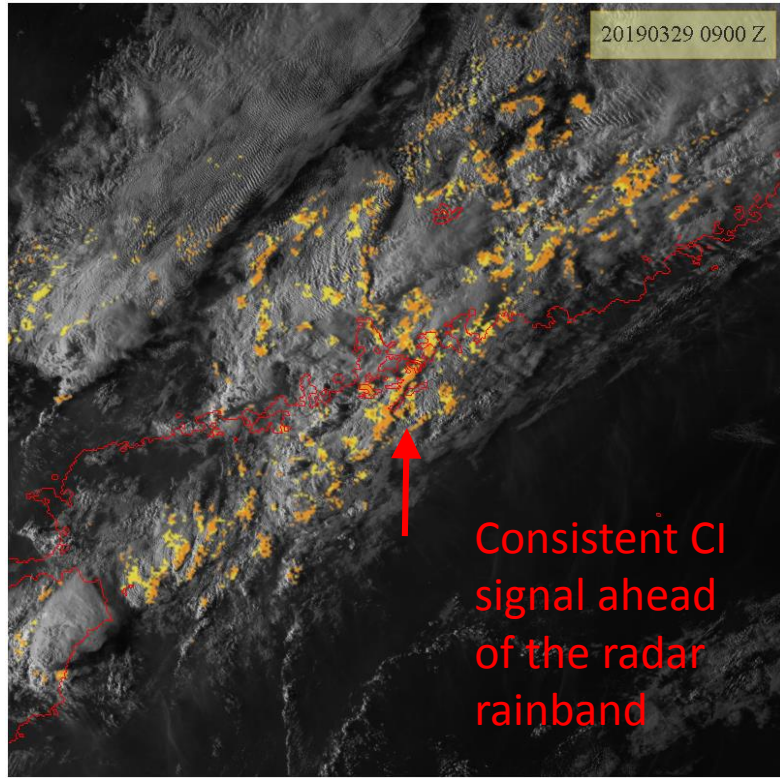

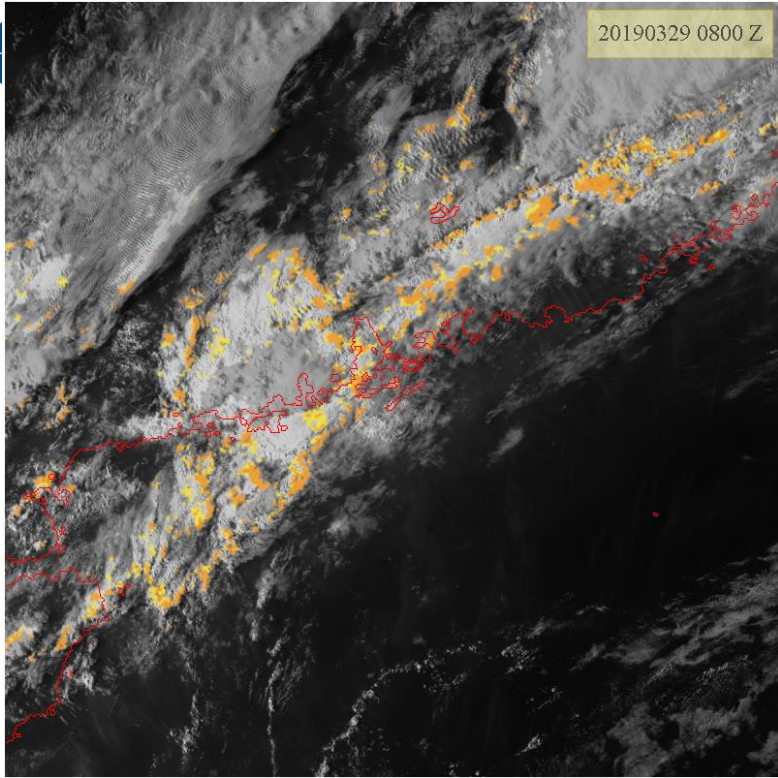

Reduced false
alarm from high
semitransparent
clouds moving
over low clouds

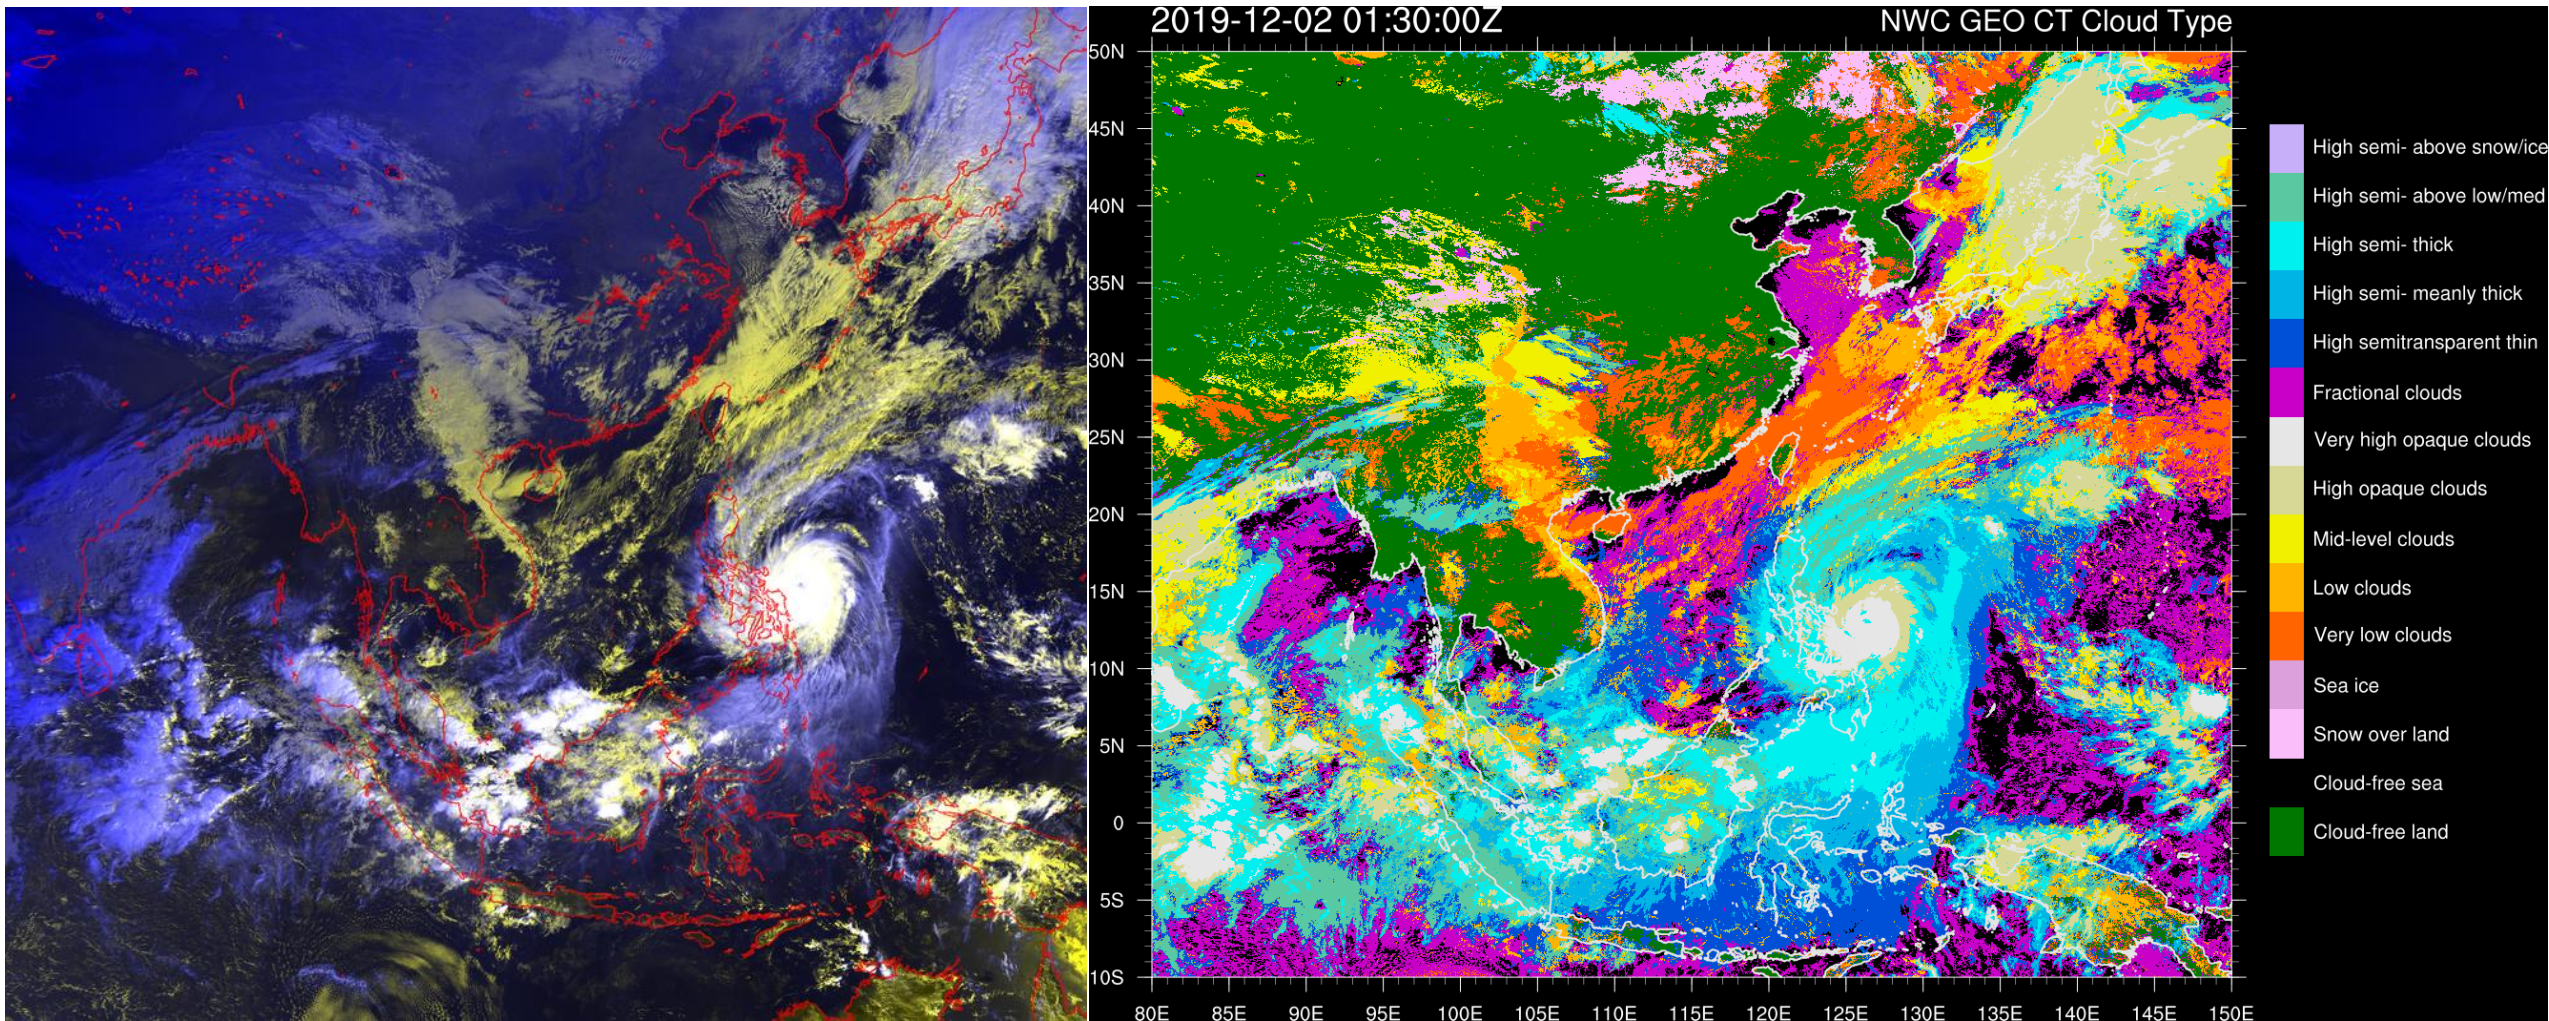

Stronger and
clearer signals
over the real
development
zones

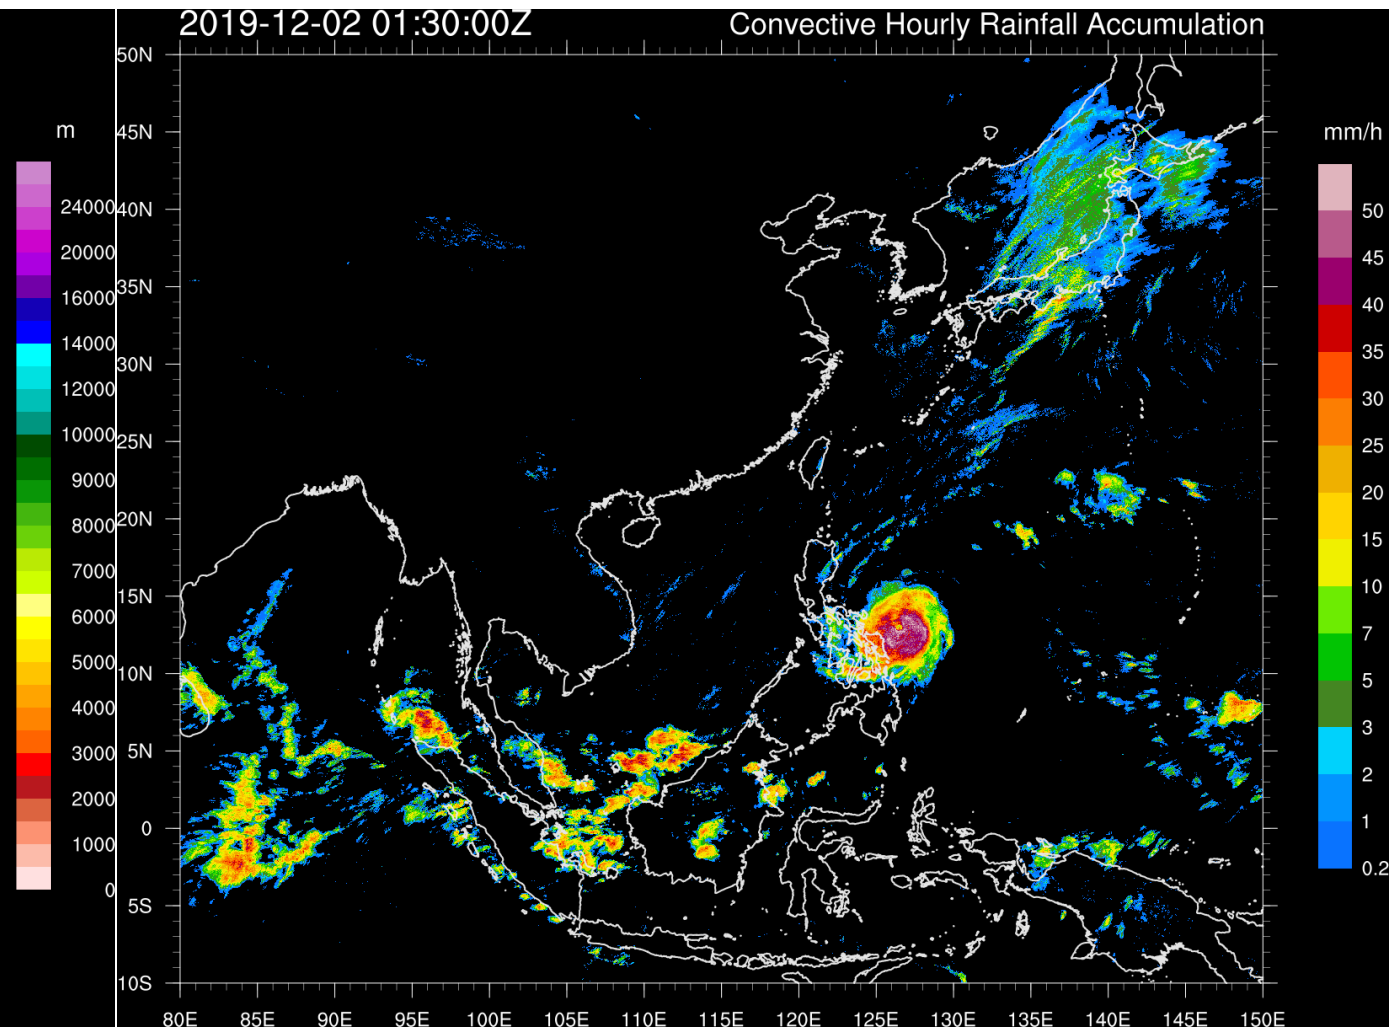

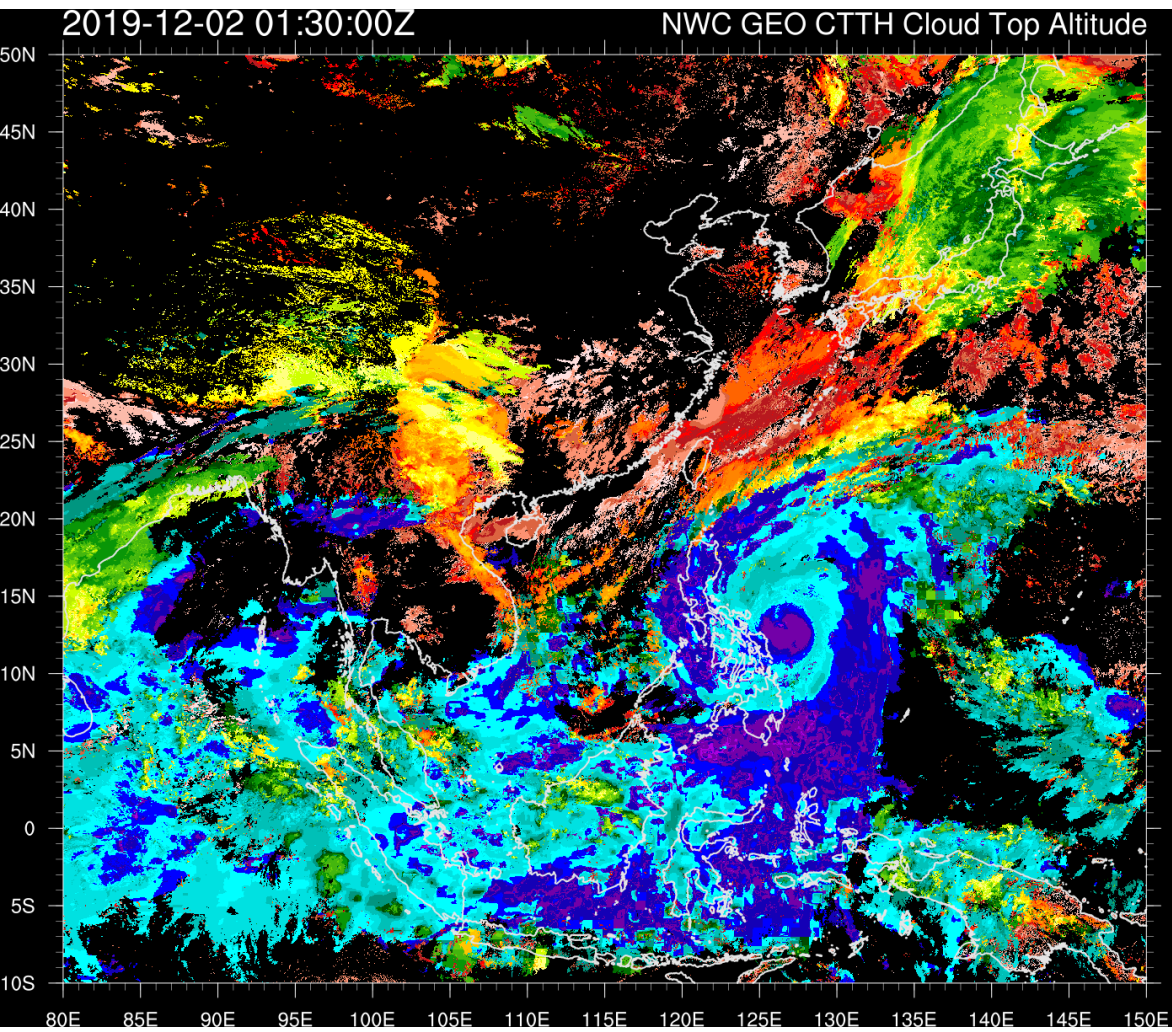

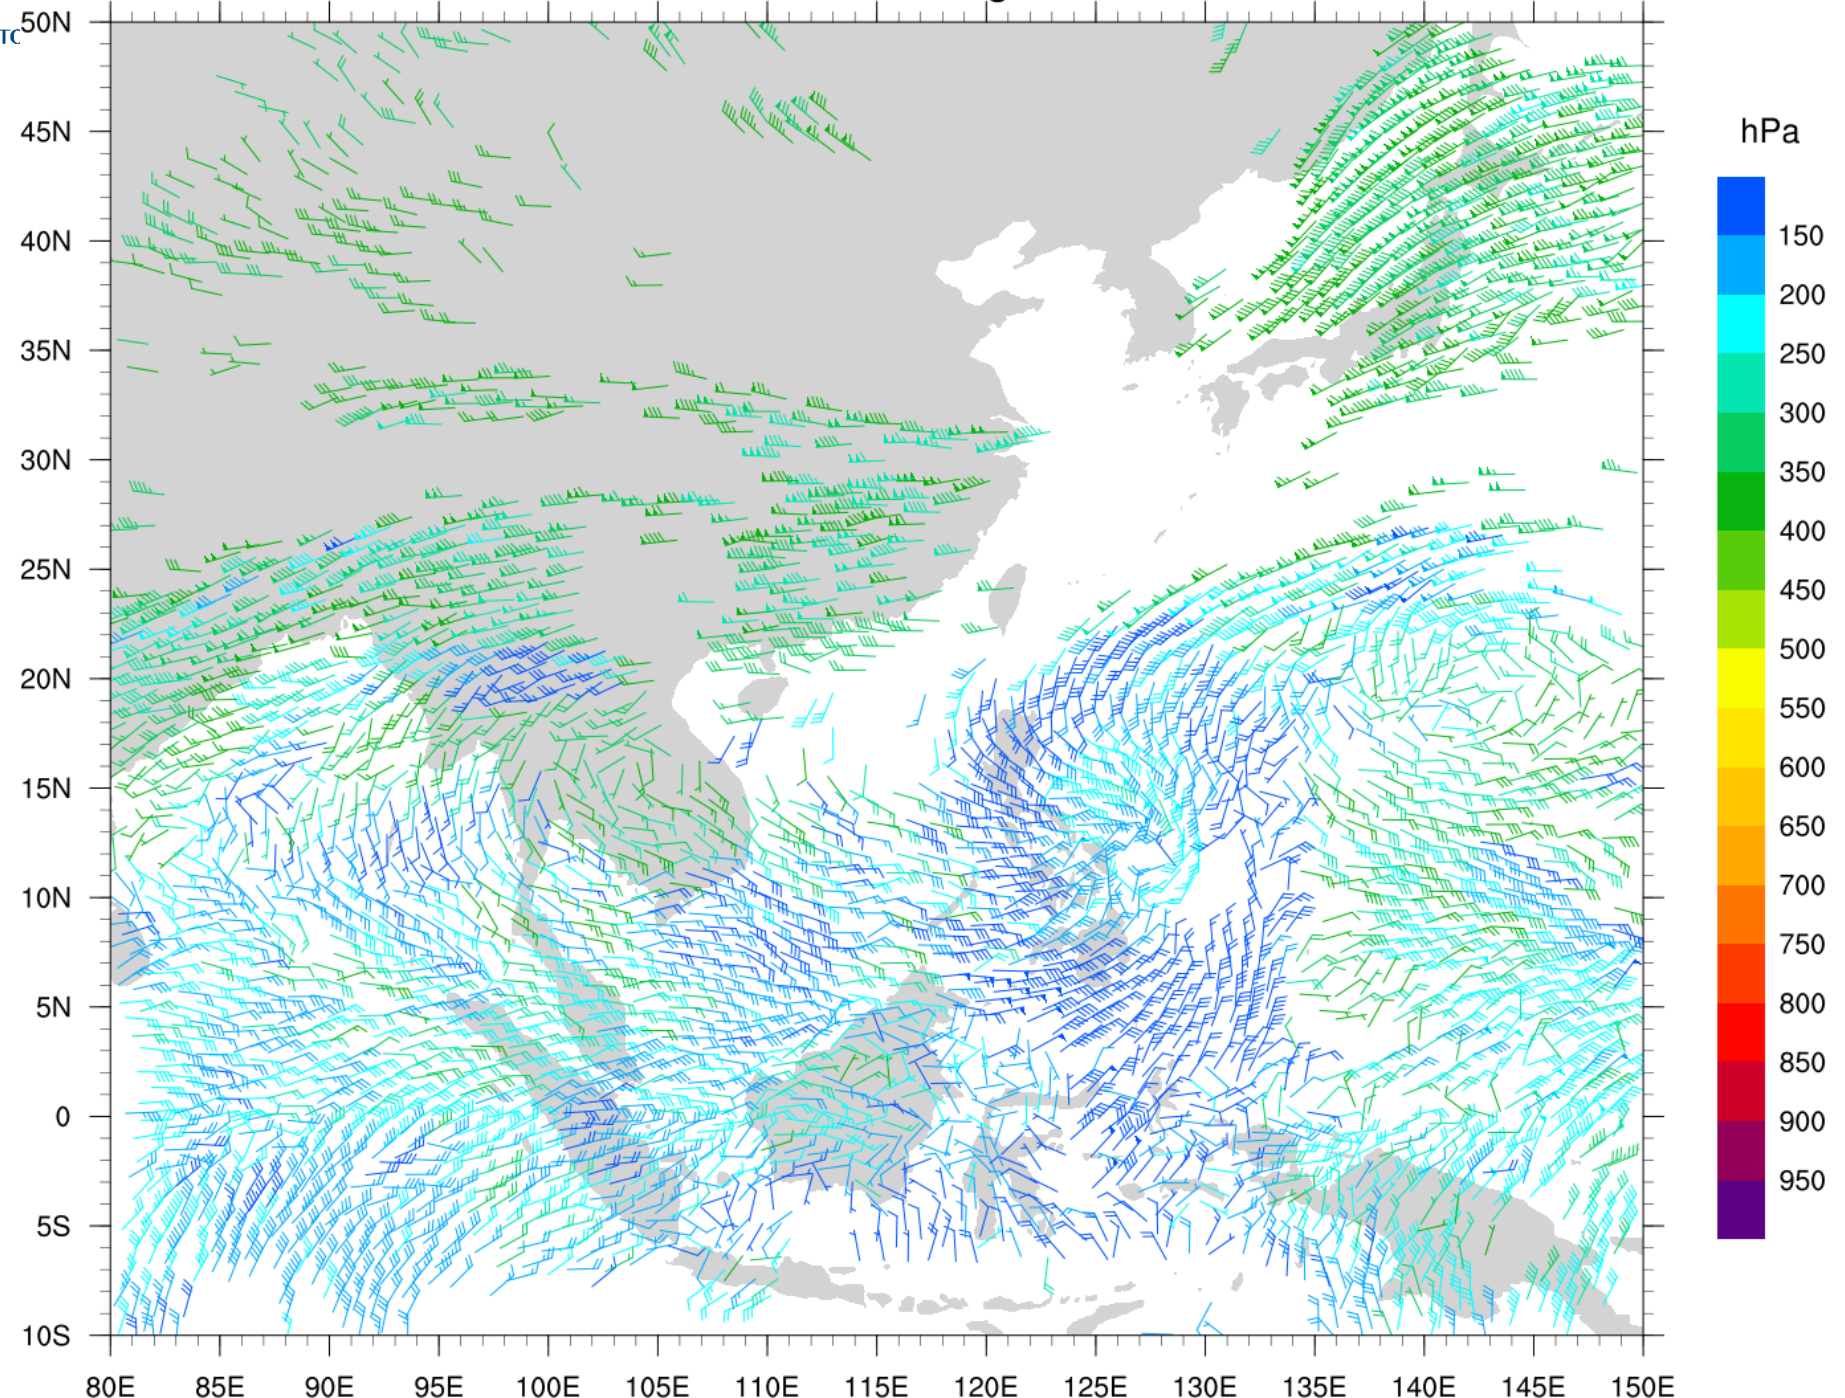

Another Example: Kammuri (2 Dec 2019)

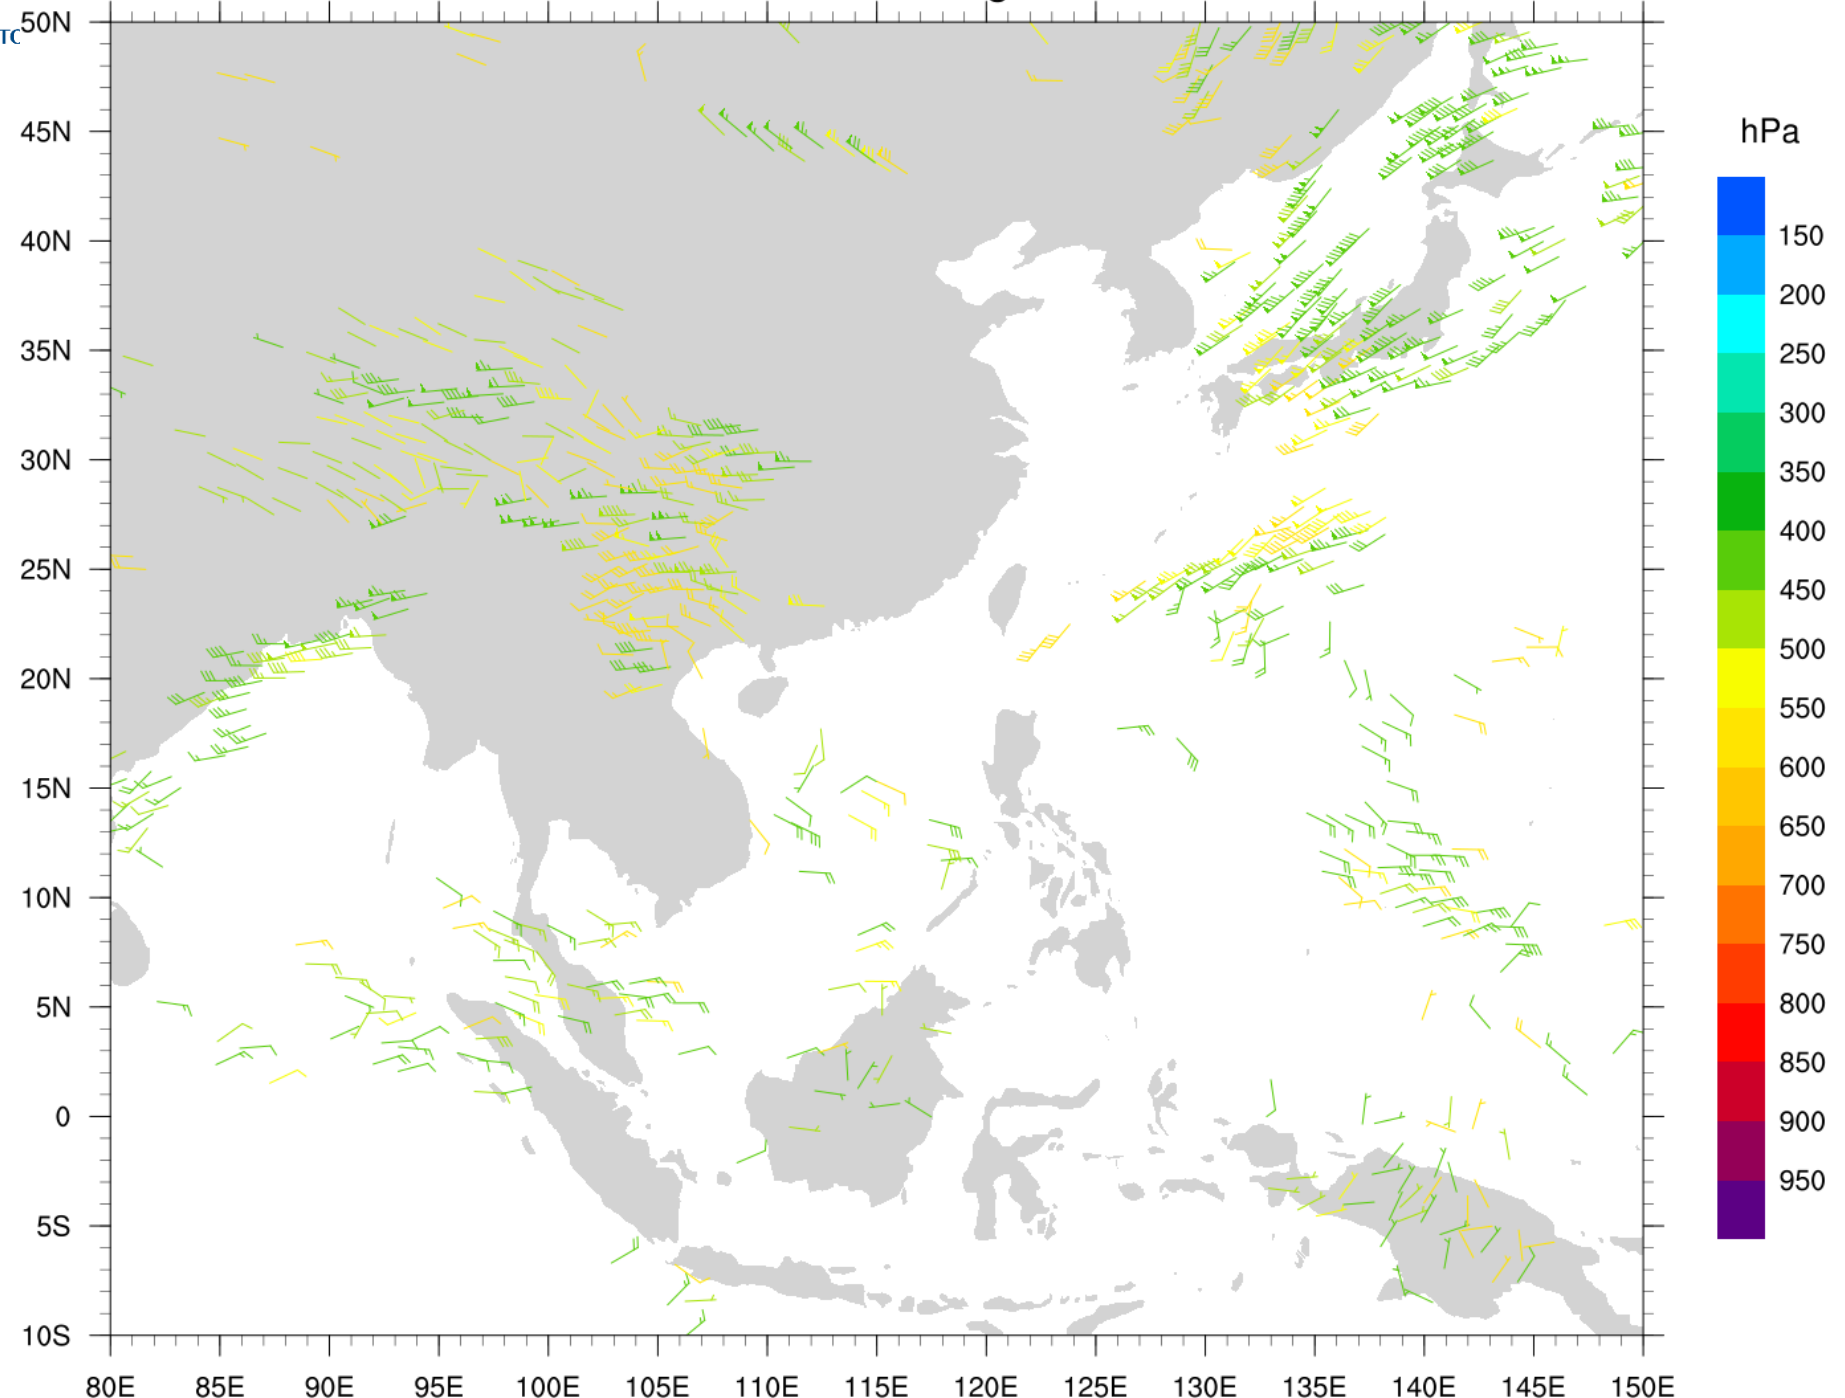

2019-12-02 01:30:00Z

High Resolution Winds: 100-400 hPa

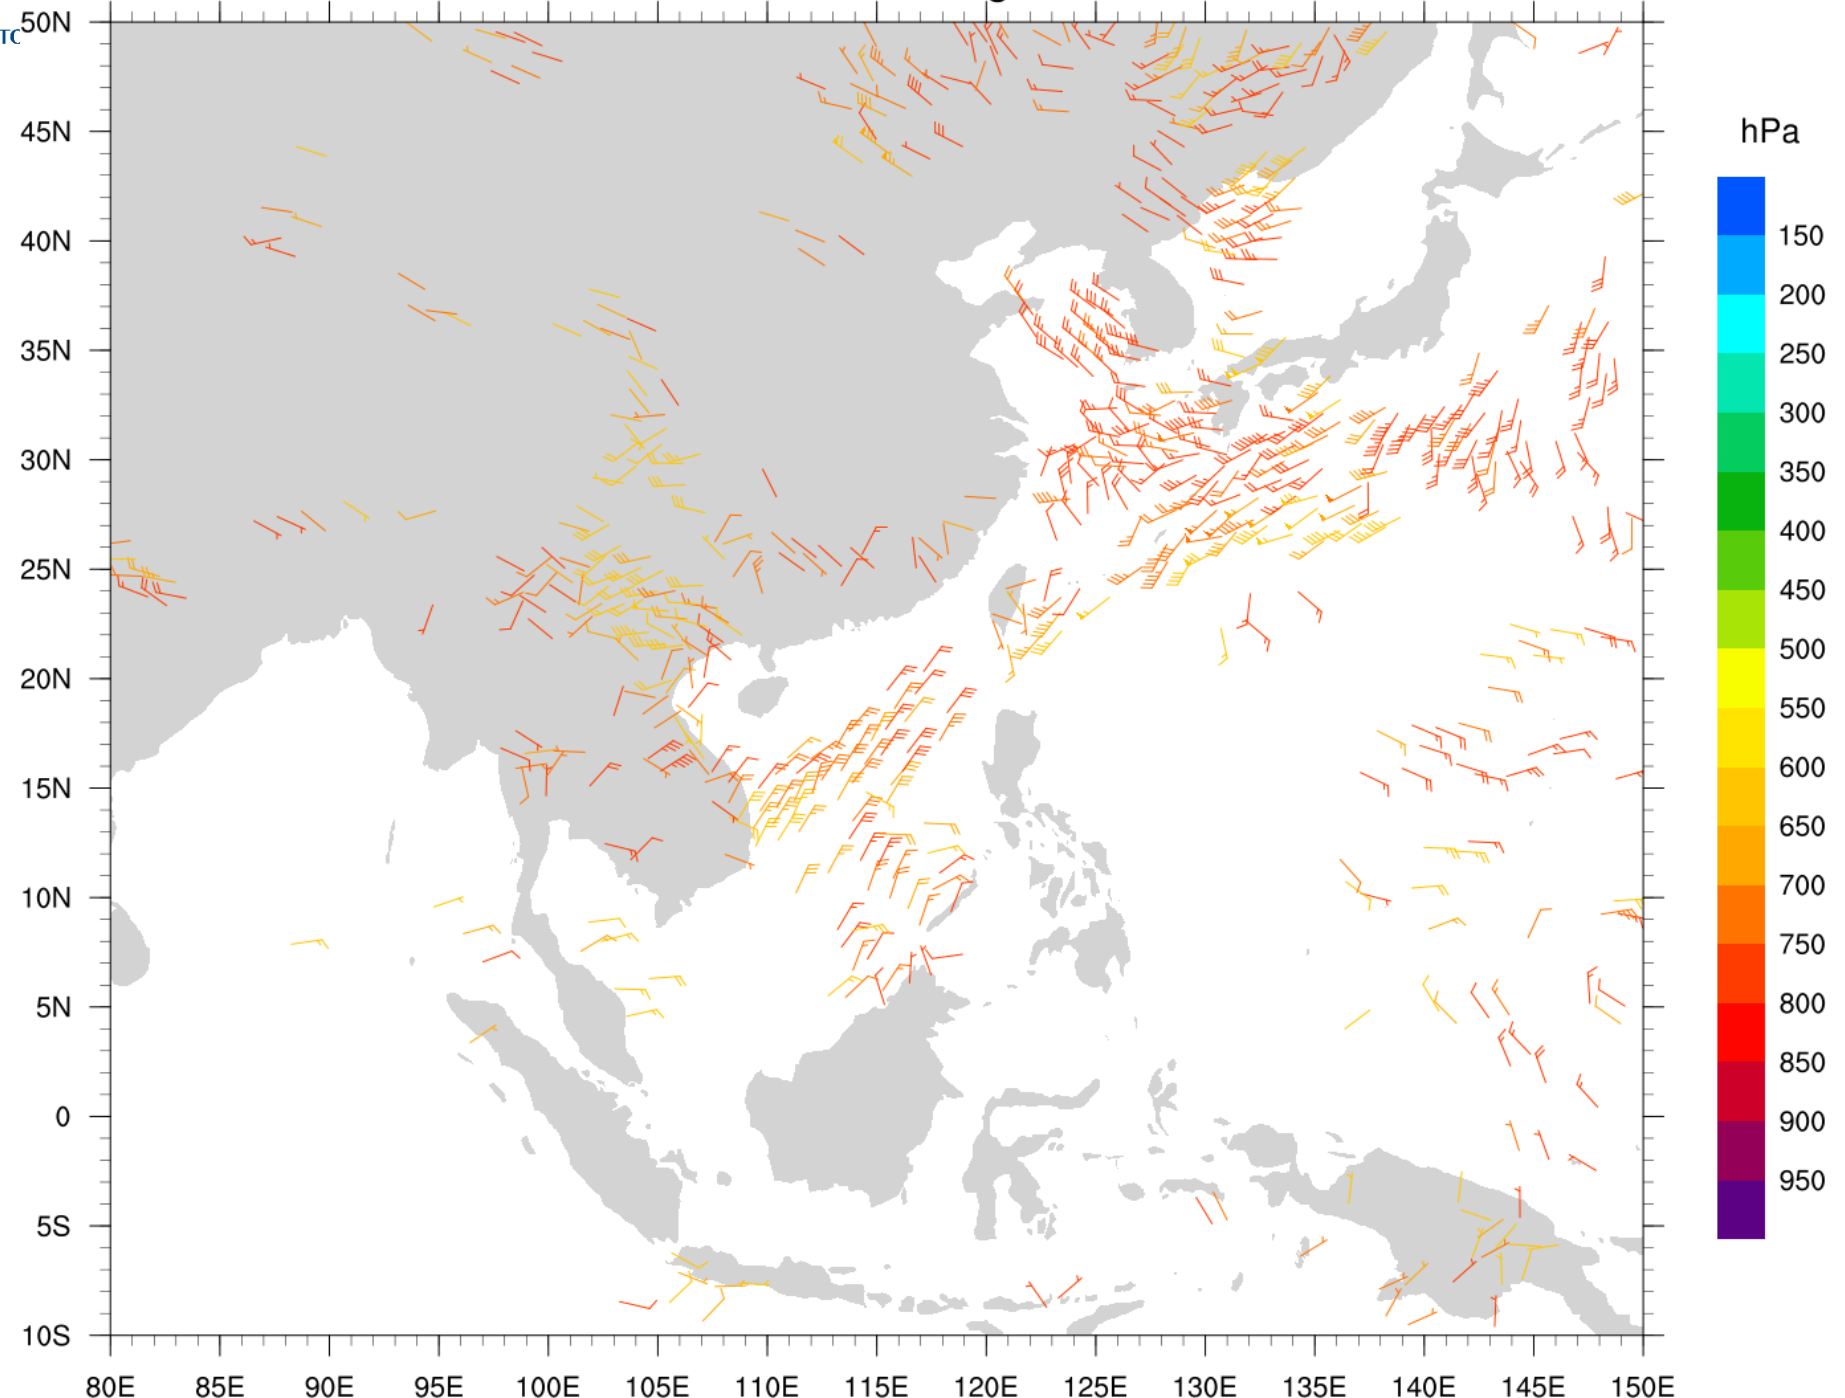

2019-12-02 01:30:00Z

High Resolution Winds: 400-600 hPa

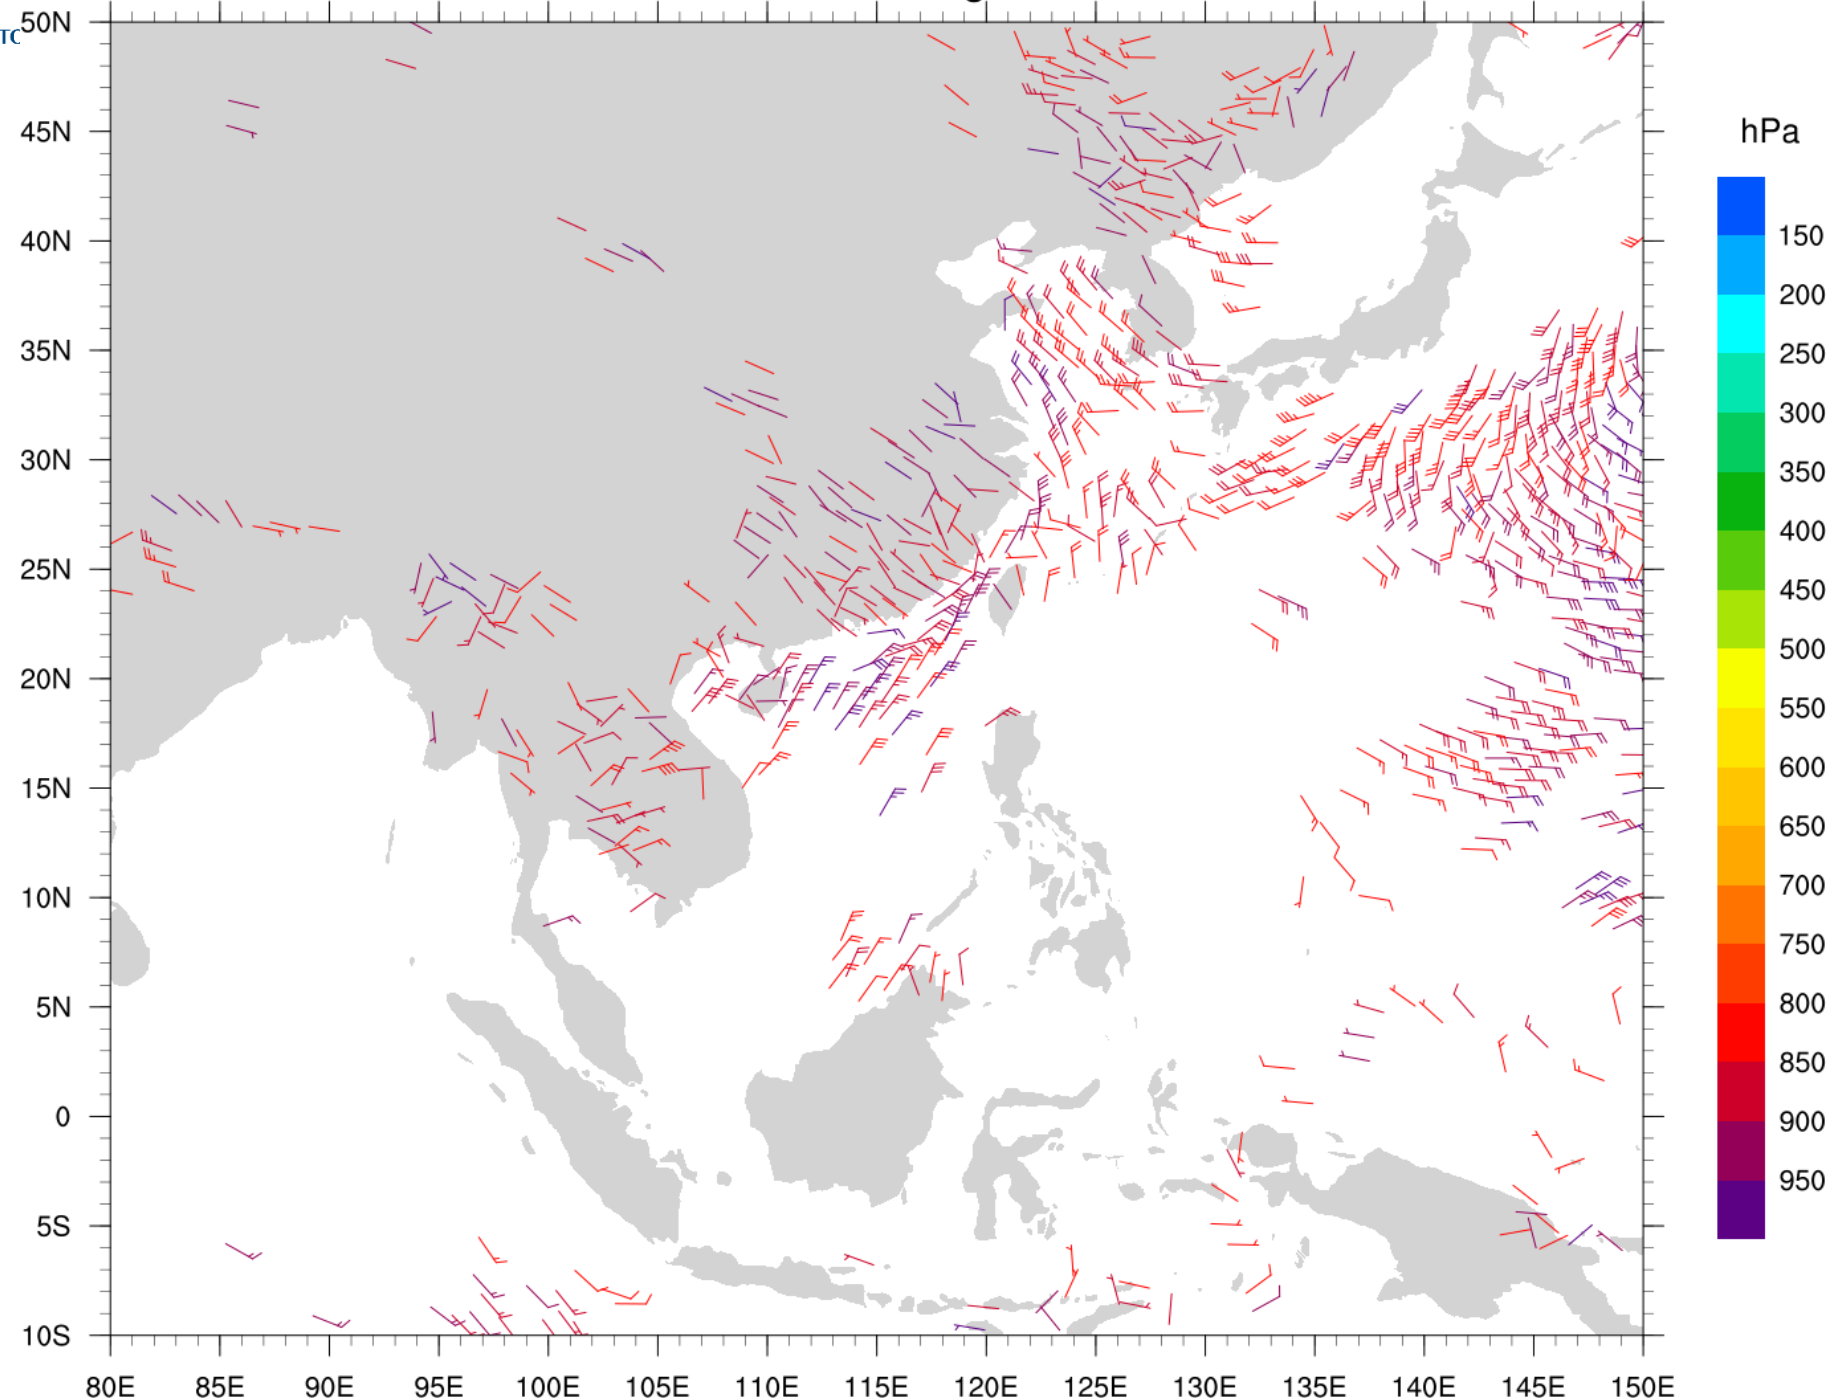

2019-12-02 01:30:00Z

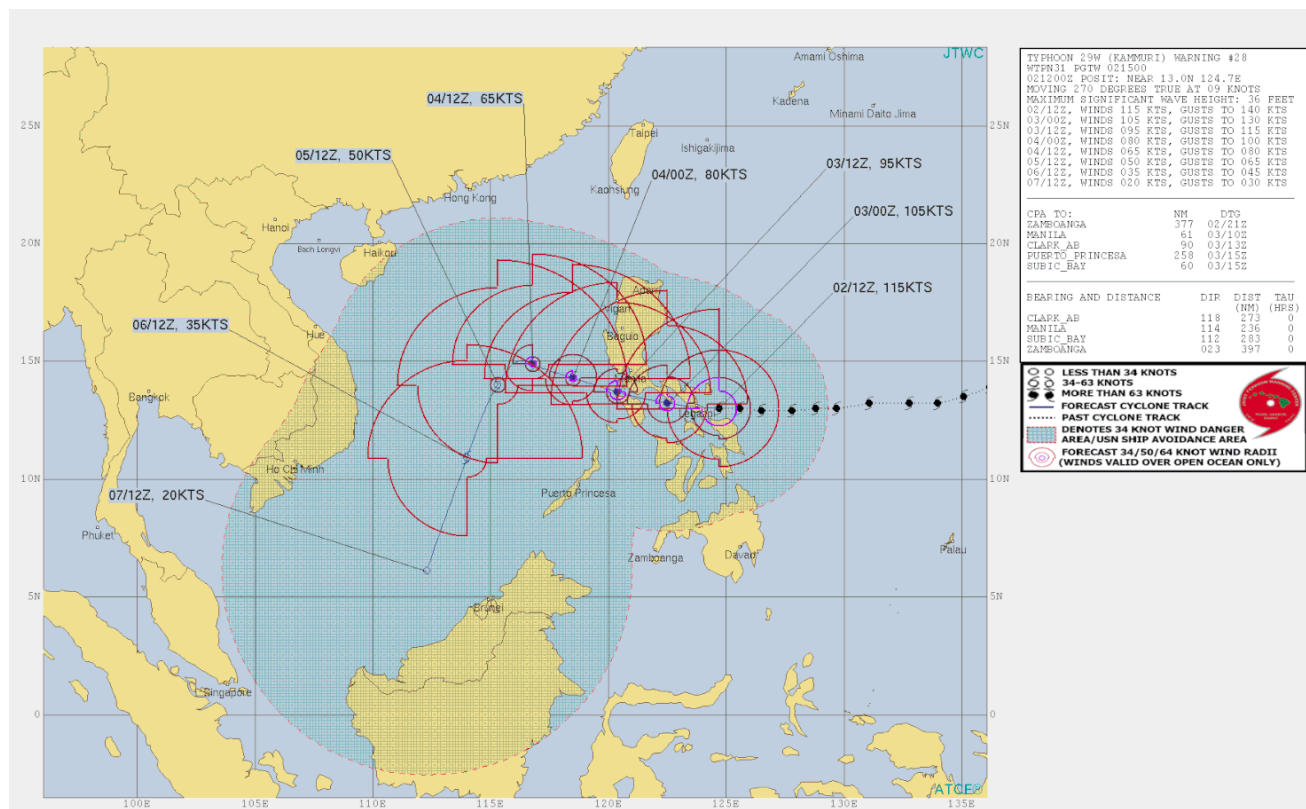

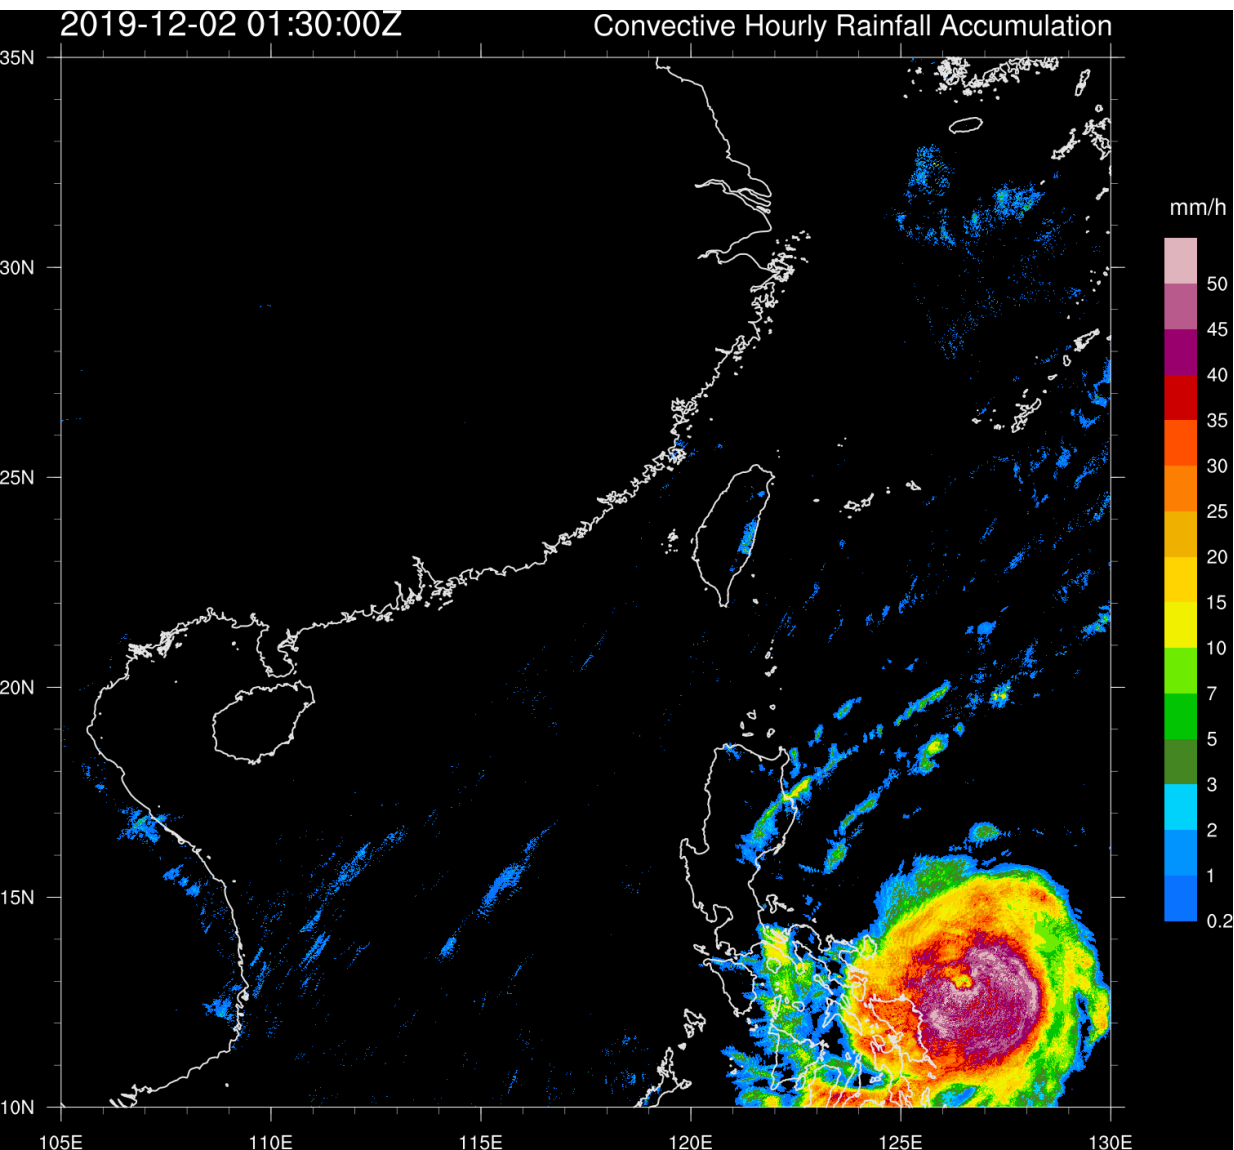

High Resolution Winds: 600-800 hPa

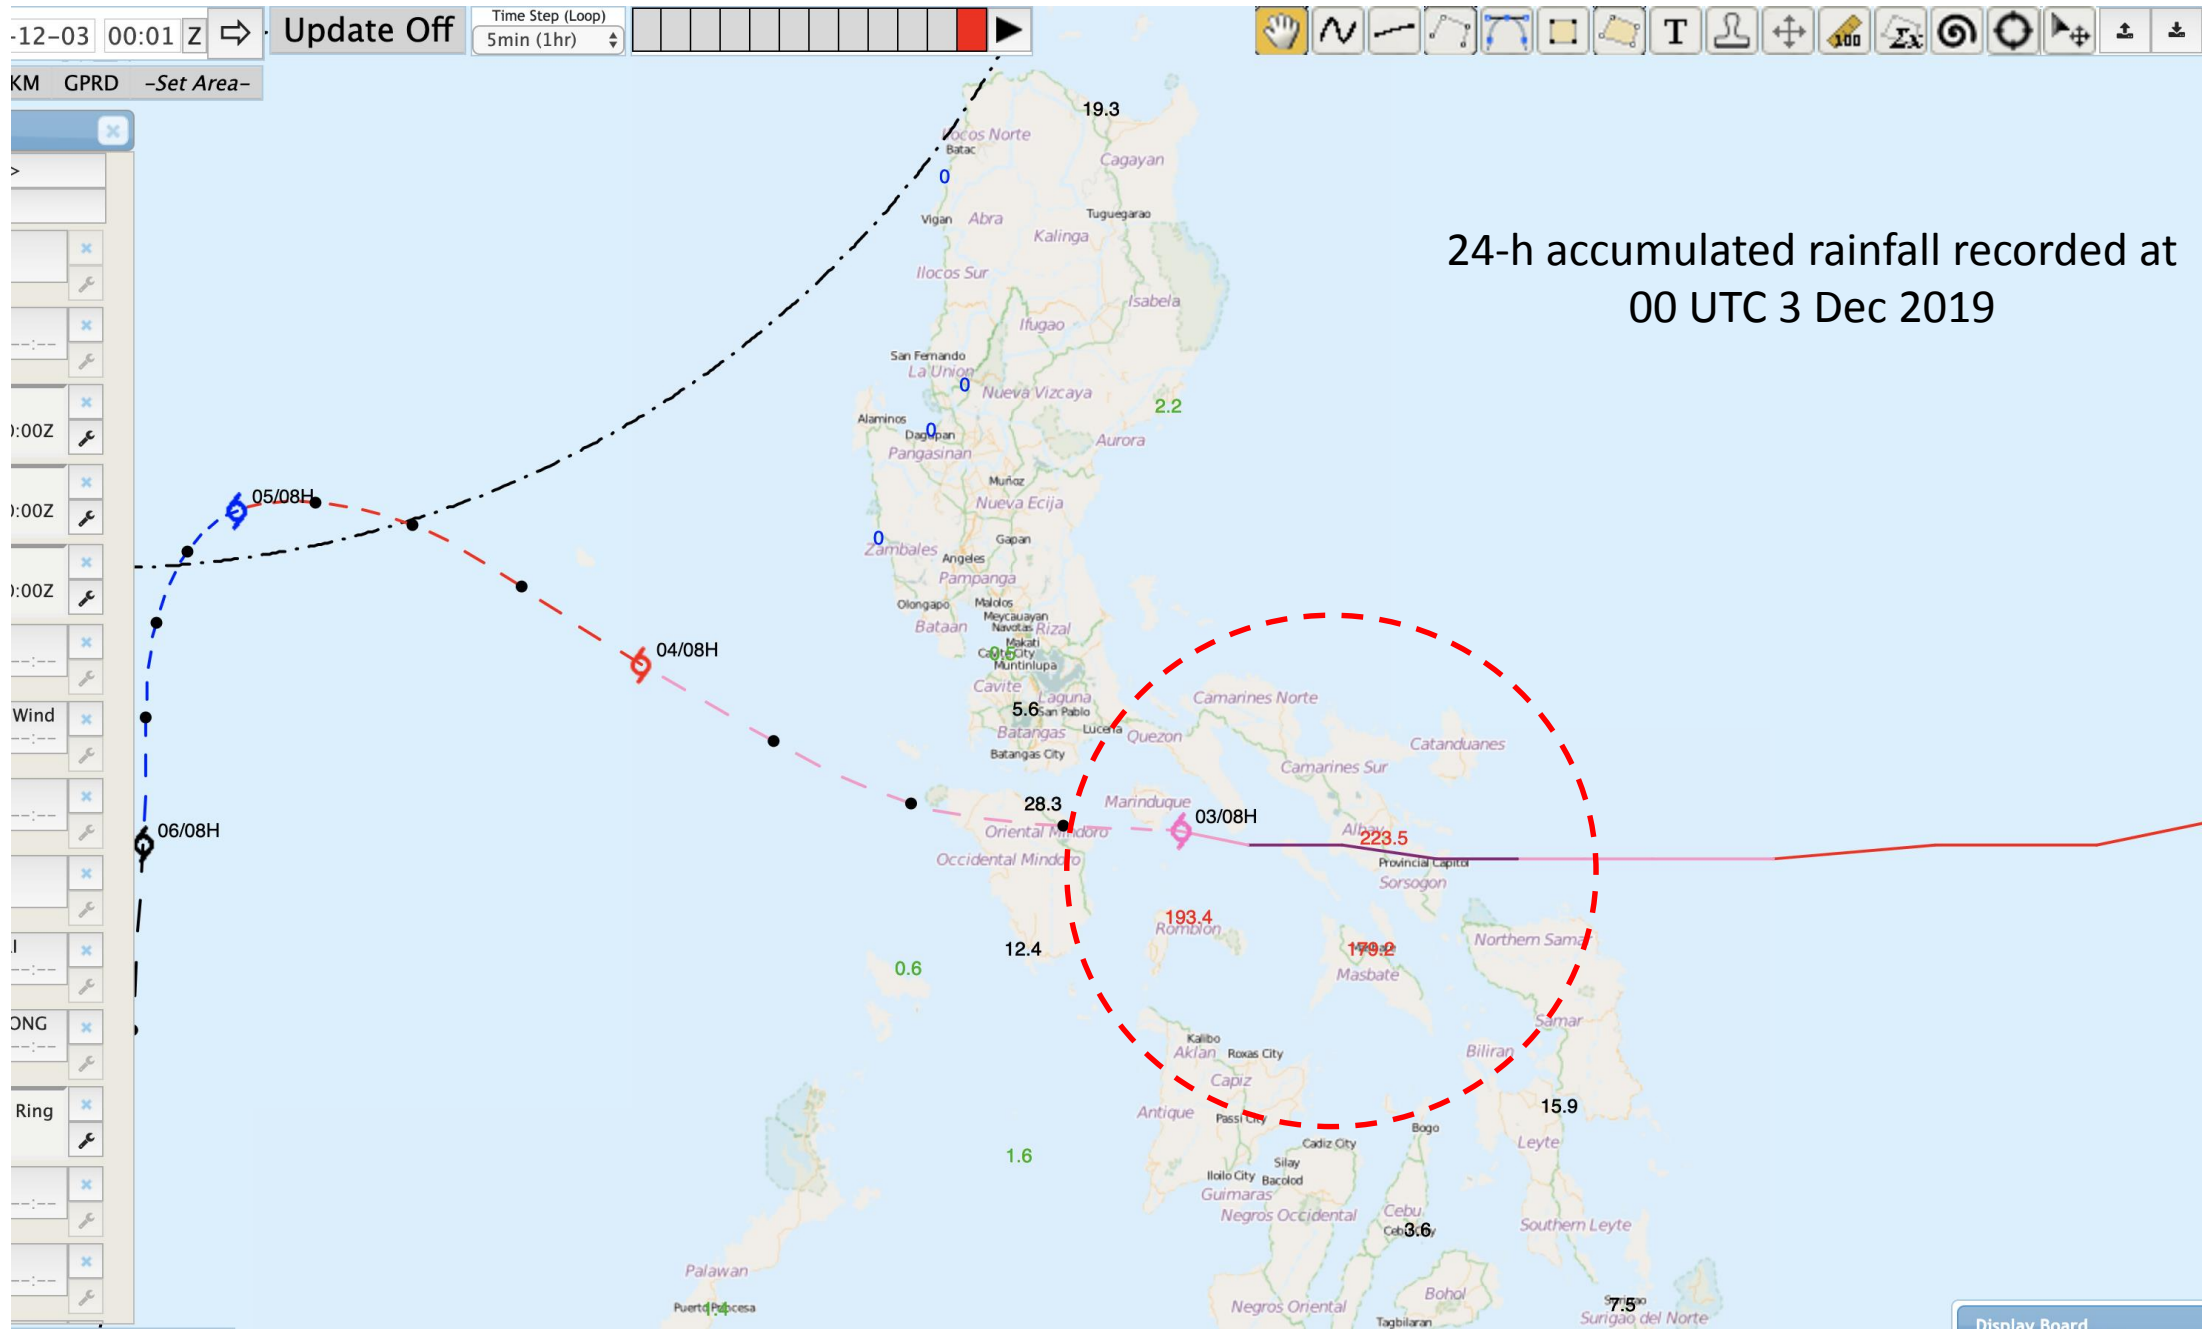

2019-12-02 01:30:00Z

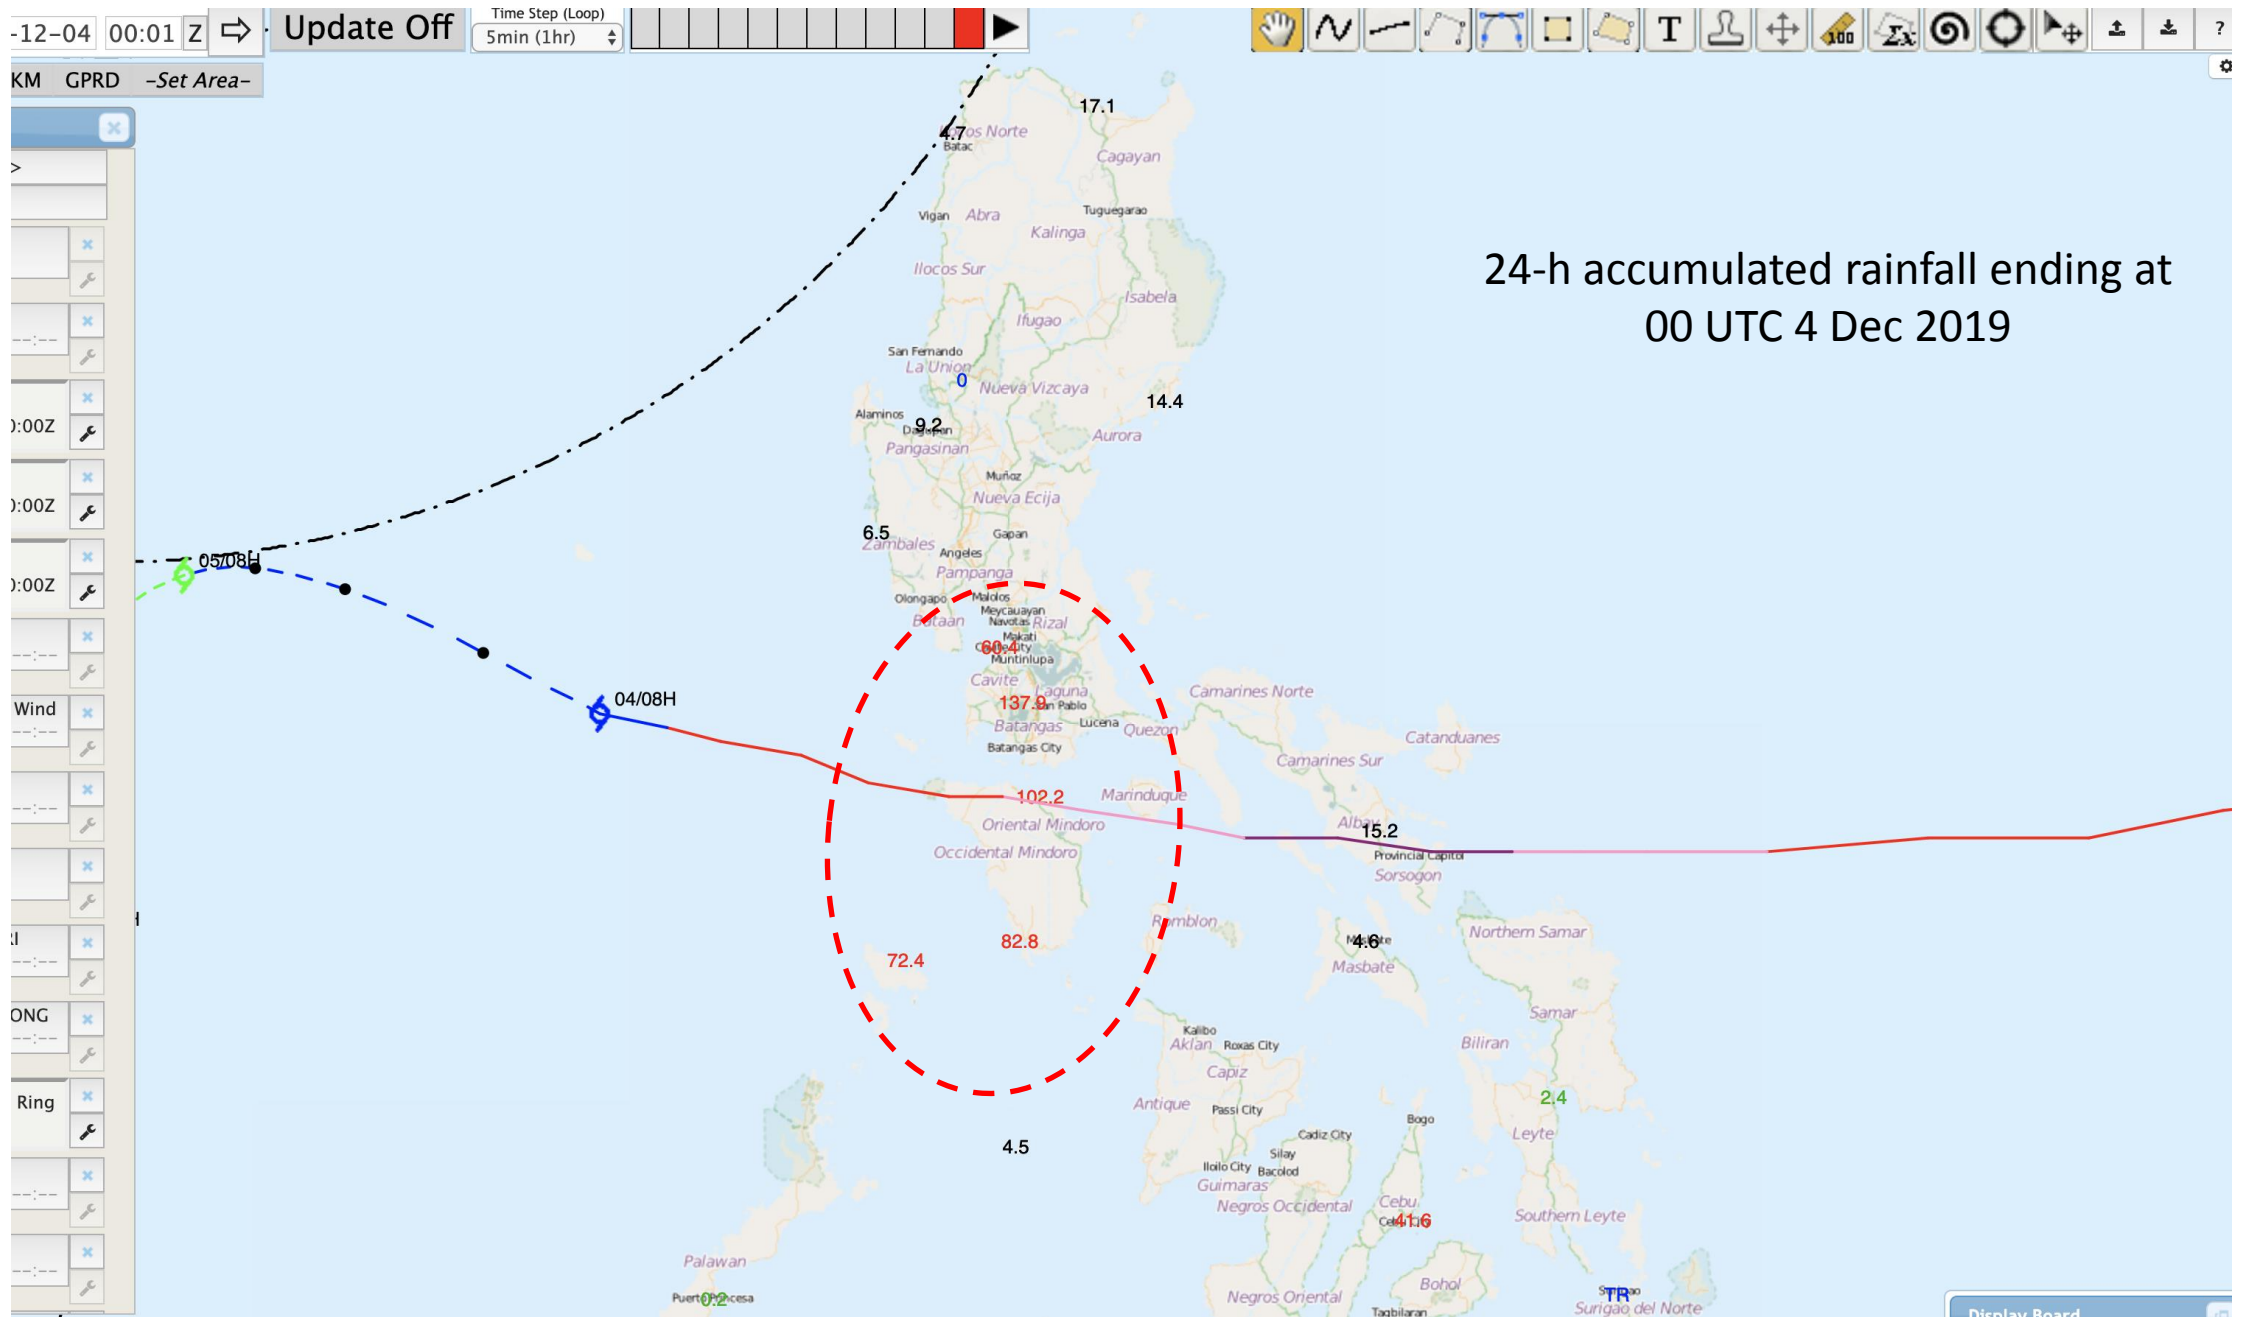

High Resolution Winds: 800-1000 hPa

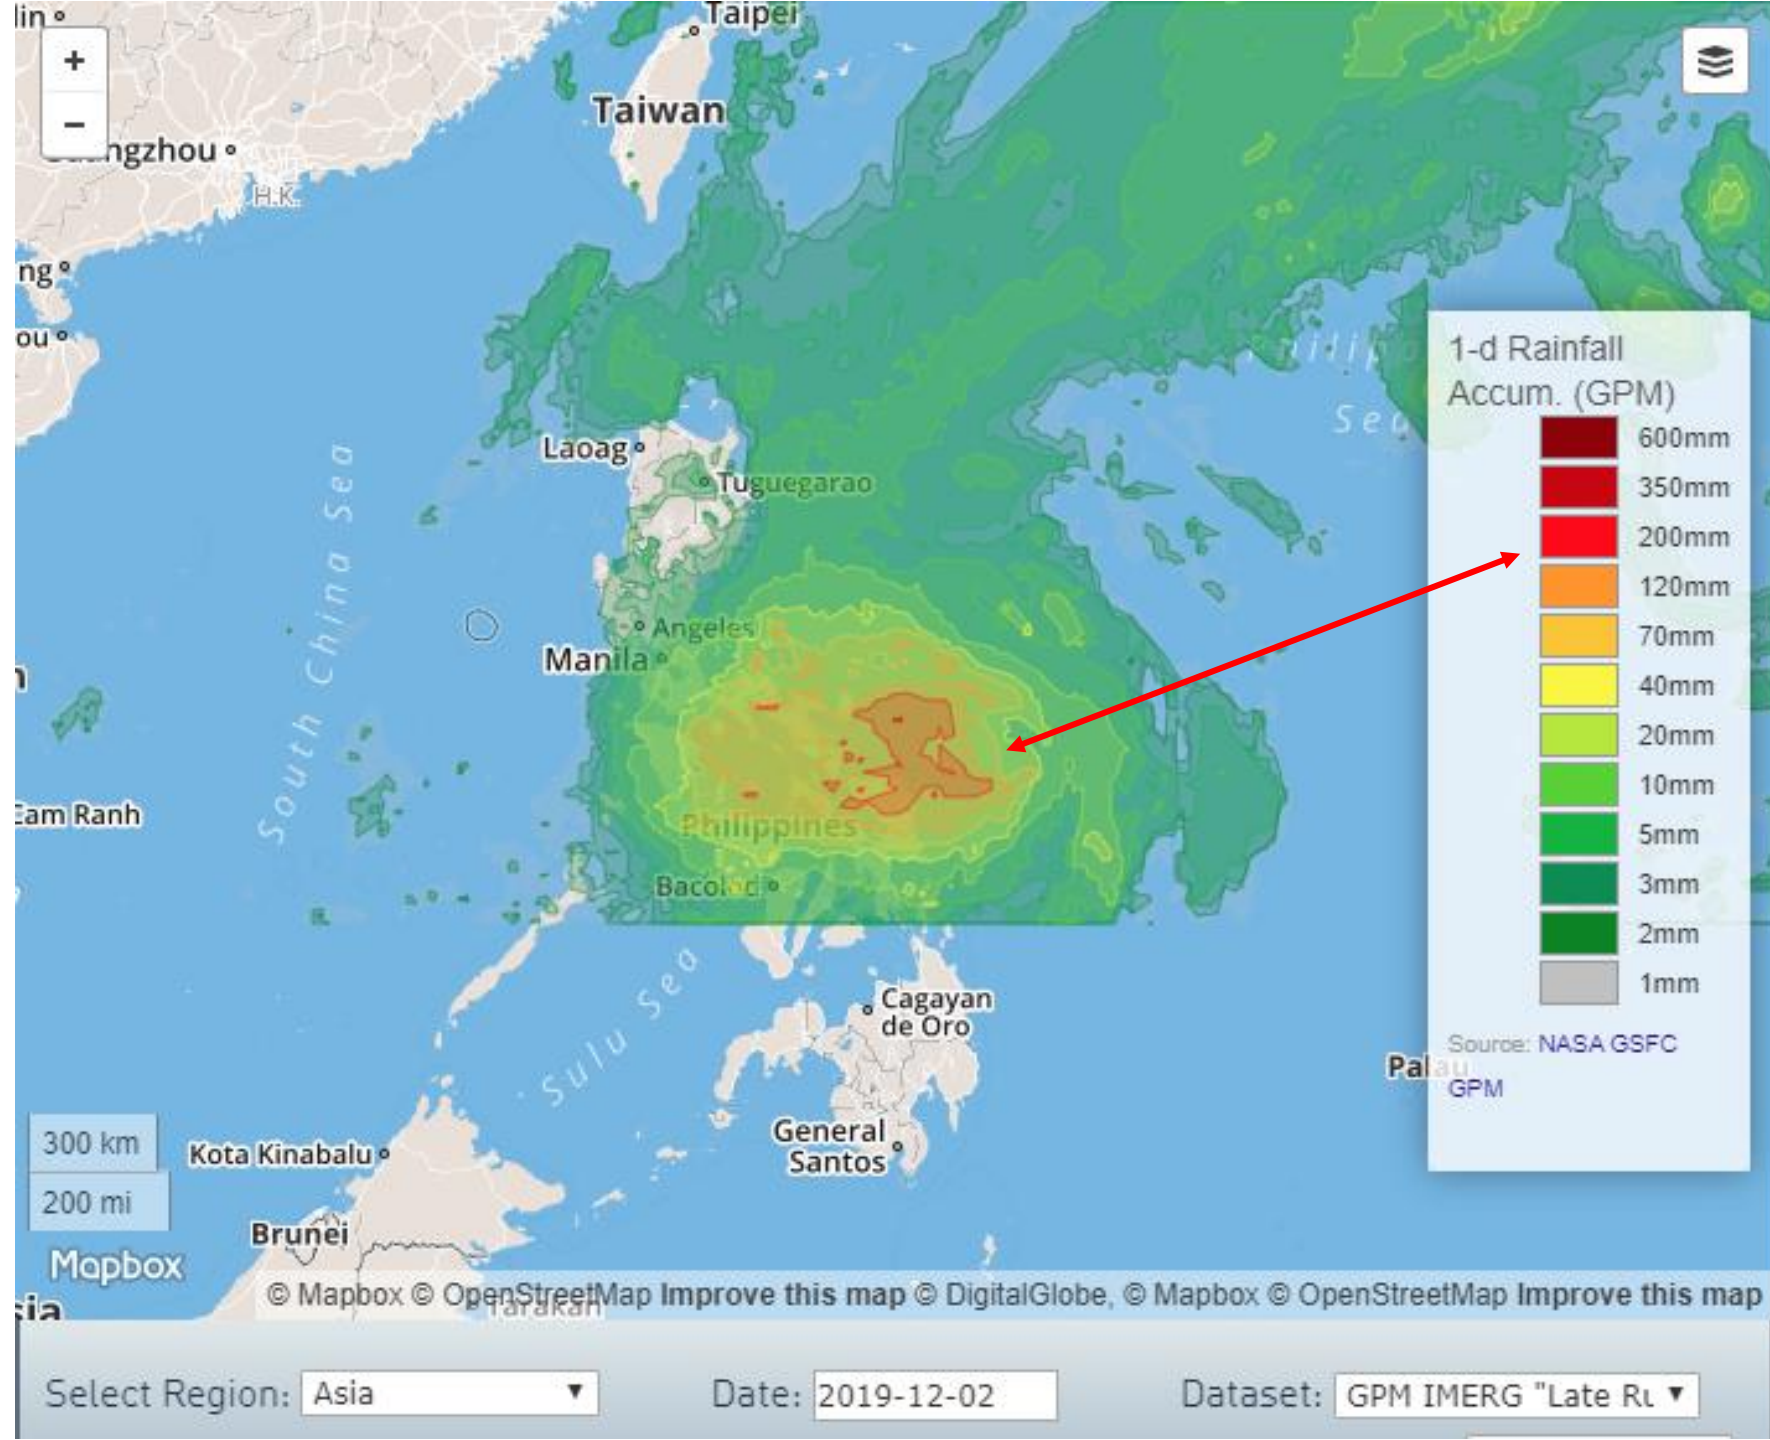

Extrapolation of CRR-Ph hourly rainfall accumulation using forecast tracks from major TC Warning Centers (e.g. HKO and JTWC above) suggested the daily rainfall on 2-3 Dec would reach a maximum of around 100 – 150 mm over the central part of the Philippines

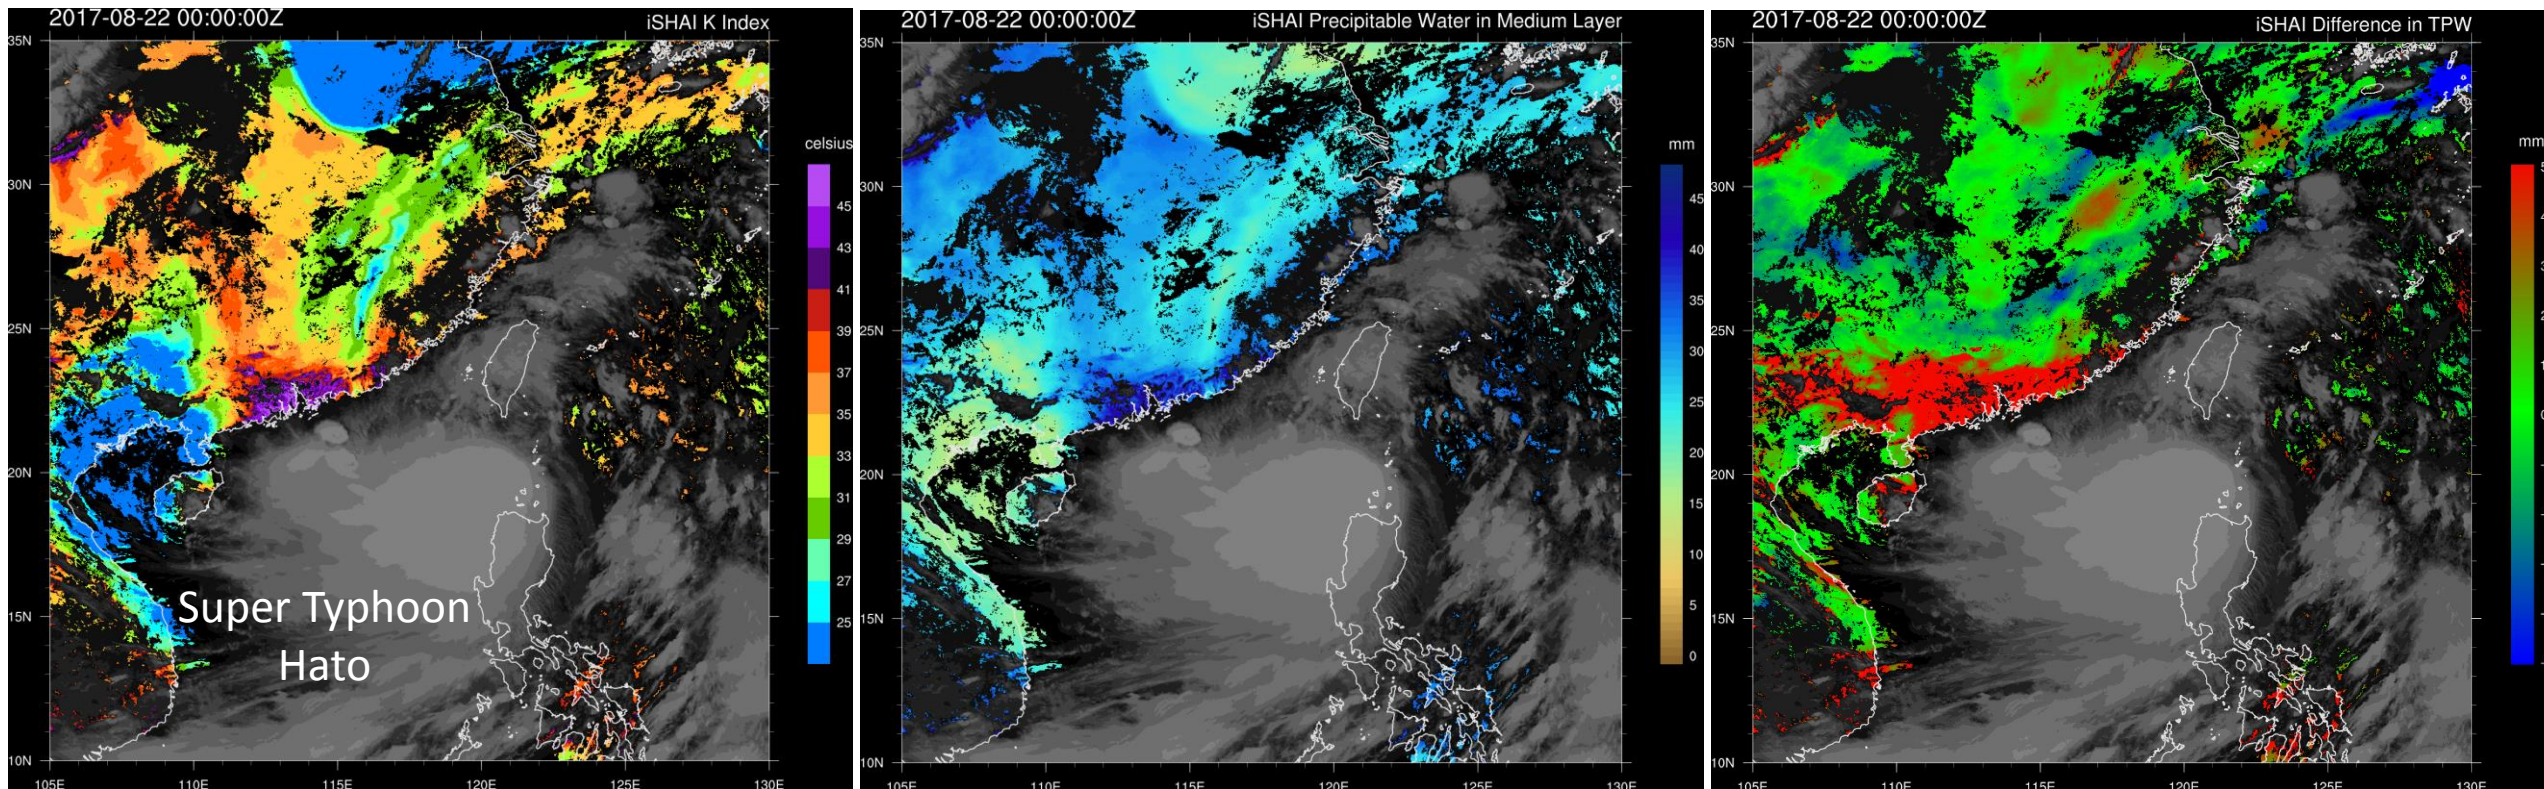

24 hr rainfall estimates on
2 Dec 2019 from GPM

New Products under Development

iSHAI retrieved profiles and derived products on stability (K-index) and precipitable water to aid forecasters' assessment of the chance of convective development

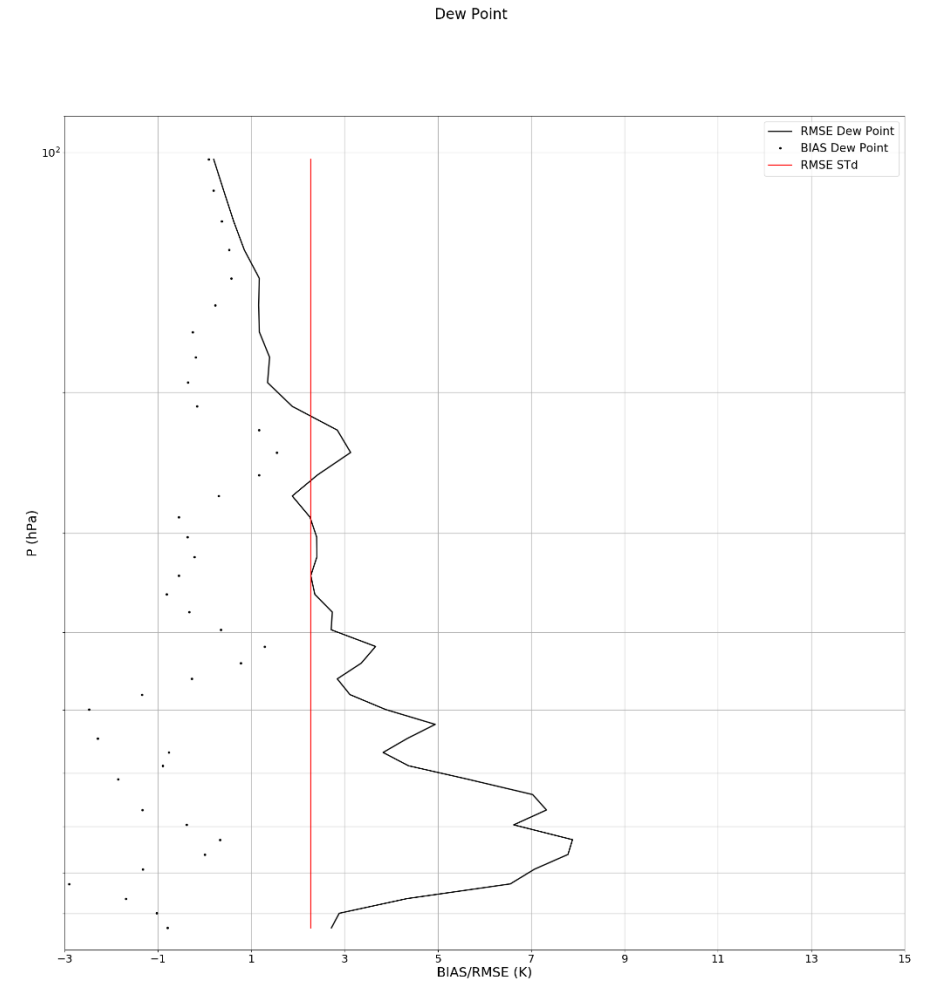

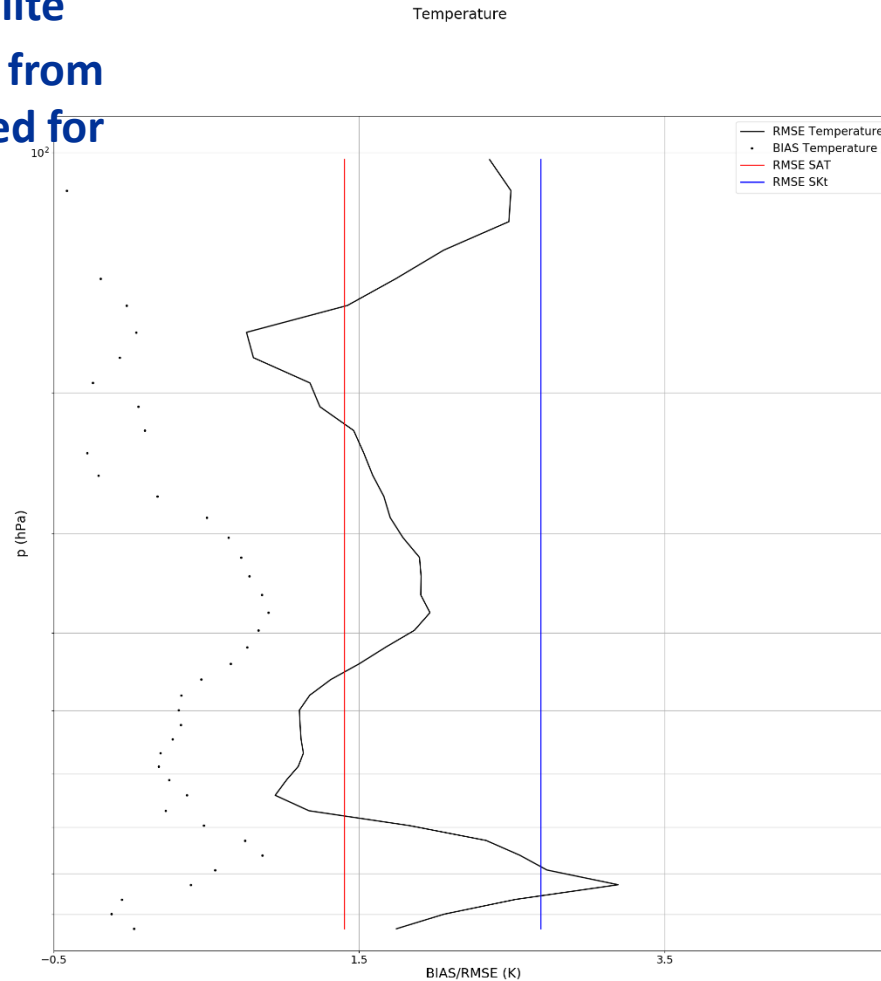

Tuning of bias BT is being studied to investigate performance of iSHAI using more vertical levels of ECMWF model forecast

Collaboration with AEMET to develop retrieval products of infrared sounder of FY4A (GIIRS)

sSHAI: sounder Satellite

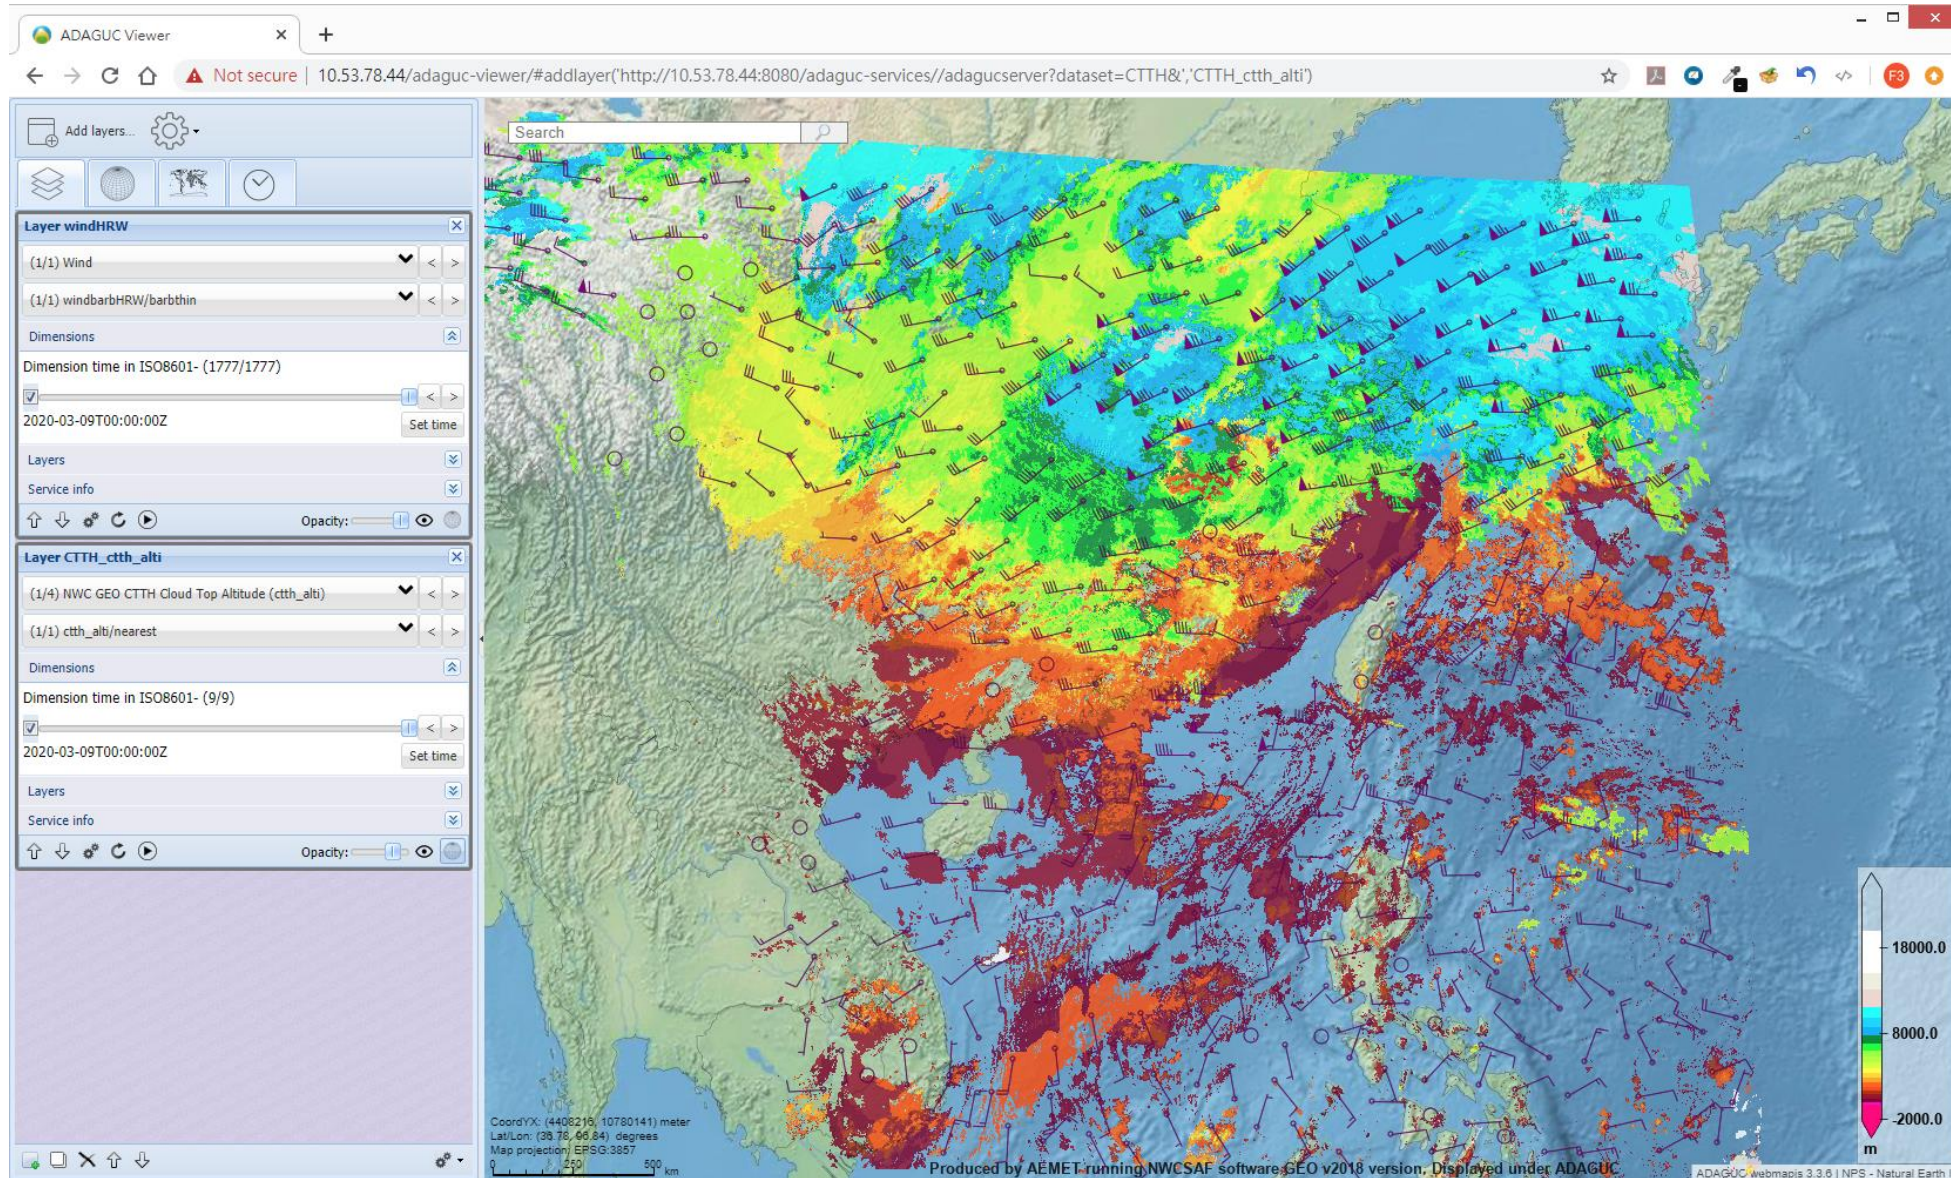

Humidity And Instability from
NWC SAF is being adapted for
FY4A GIIRS

Adaguc visualization platform

Adaguc Viewer is being adapted to visualize NWC GEO products

Thanks to support from Llorenc Llisó.

Concluding remarks

- NWC SAF/GEO has been implemented for trial operation in HKO using JMA Himawari-8 to support monitoring and nowcast of convective weather with much extensive coverage compared to available radars or regional mosaic
- Forecasters at HKO and Aviation Meteorological Office find the products very useful such as cloud top height, cloud types, CI/RDT, HRW and CRR-Ph
- Several SAF/GEO products demonstrated potential applications in monitoring of intensity changes of tropical cyclones; HRW data are assimilated to generate upper-air wind analysis with increased temporal resolution
- New developments and collaborations with AEMET are underway:
 - iSHAI
 - Adaguc Viewer
 - sSHAI
 - Satellite-radar blended QPE
